9. **DRACOCEPHALUM**, L. DRAGONHEAD. Forty species in Eu. and Asia, about 4 in N. Amer., sometimes found in fl.-gardens.—Ann. or per. herbs or sometimes woody at base, mostly erect: lvs. entire, toothed or deeply cut, the floral lvs. similar or reduced to bracts: floral whorls axillary or in terminal spikes; calyx tubular, 2-lipped, 5-toothed; corolla purple, blue or rarely white, the upper lip notched and arched, the lower 3-cleft with the middle lobe notched or cleft; stamens 4, the 2 anther-cells divaricate: nutlets smooth. (*Dracocephalum*: Greek *dragon's head*, from shape of corolla.)—As here considered, the genus includes *Moldavica*, Adans.

- A. Lvs. entire.
 B. Fls. $\frac{3}{8}$ – $1\frac{1}{2}$ in. long.....1. *D. Ruprechtii*
 BB. Fls. $\frac{3}{8}$ –1 in. long or more.....2. *D. Ruyschiana*
 AA. Lvs. toothed.
 B. Fls. $\frac{1}{2}$ in. long.....3. *D. nutans*
 BB. Fls. 1–2 in. long.
 C. Calyx-tube only as long as lower lobes or shorter: lvs. incised-crenate.....4. *D. Moldavica*
 CC. Calyx-tube twice as long as lower lobes: lvs. serrate.....5. *D. sibiricum*

1. *D. Ruprechtii*, Regel. Per. to 2 ft., suffrutescent, sts. glabrous: lvs. narrowly elliptic to linear-lanceolate, to $1\frac{1}{2}$ in. long, entire, glabrous, acute; bracts elliptic-lanceolate, ciliate, resinous-dotted, apiculate; calyx puberulent, resinous-dotted, teeth sharply acuminate and

setaceous; corolla blue to bluish-lavender, about $\frac{3}{8}$ in. long, minutely and sparsely puberulous without, glabrous within, tube not exceeding calyx; anthers glabrous; July–Aug. (Named for Franz J. Ruprecht, page 50.) Turkestan.

2. *D. Ruyschiana*, L. Per. 2 ft. high, with slightly pubescent sts.: lvs. linear-lanceolate, to 2 in. long, entire, glabrous; bracts ovate-lanceolate, ciliate, cuspidate-tipped: calyx finely pubescent, resinous-dotted, the teeth cuspidate-tipped; corolla 1 in. long, blue or bluish or in one var. white shaded with blue, hairy, the tube not exceeding the calyx, the throat funnelform; anthers villous. (Named for Frederik Ruysch, 1638–1731, Dutch anatomist and botanist.) Eu., Asia. Var. *japonicum*, Mast. (*D. argunense*, Fisch.), corolla paler, to $1\frac{1}{2}$ in. long; Japan.

3. *D. nutans*, L. Per., sts. to 1 ft. high, appressed-pubescent: lvs. ovate or oblong, $\frac{3}{4}$ –2 in. long, coarsely crenate-serrate, subglabrous except for ciliate margins, petioled: fl.-whorls in leafy spikes commonly 2–6 in. long; corolla bright blue, $\frac{1}{2}$ in. long, puberulent. Cent. Asia.

4. *D. Moldavica*, L. (*Moldavica suaveolens*, Gilib.). Fragrant ann. 1–2 ft. high, erect and branching, branches glabrous or finely pubescent: lvs. lanceolate, to $1\frac{1}{2}$ in. long, blunt, incised-crenate, the lower long-petioled, the upper and floral lvs. short-petioled and toward base bristly-toothed: fls. few in a whorl, the whorls in a long raceme, July–Aug.; corolla blue or white, two to three times as long as the calyx. (First described under the old genus *Moldavica*, named from Moldavia, formerly a province along the Danube.) Eu., N. Asia.

5. *D. sibiricum*, L. (*D. Stewartianum*, Hort. not Dunn. *Nepeta macrantha*, Fisch.). Per. to $4\frac{1}{2}$ ft., branched, subglabrous below, puberulent above: lvs. short-petioled, ovate-lanceolate, to 4 in. long, serrate, truncate or cordate at base: infl. subpaniculate, with few-fl. clusters, bracts not conspicuous; fls. blue, $1\frac{1}{2}$ in. long, funnelform, conspicuously bilabiate; calyx-tube twice as long as lower lobes. Siberia.

10. **PRUNELLA**, L. Low per. herbs, about 5 species widely dispersed in temp. climates.—Sts. ascending, usually simple, with few pairs of petioled lvs.: fls. mostly in 3's in axils of leafy ovate bracts and compacted into terminal head-like spikes; calyx tubular-campanulate, irregularly 10-nerved, with broad 3-toothed upper lip and 2-cleft lower lip; corolla ascending, slightly contracted at throat, 2-lipped, upper lip arched, lower 3-lobed; stamens 4, filaments glabrous, 2-toothed at apex, the lower tooth bearing the anther; style glabrous, stigmas 2, short: nutlets ovoid, smooth, angled. (Prunella: name said to be from the German *Braune*, a disease of the throat, for which the plant was a remedy; genus sometimes spelled Brunella.)

A. Upper foliage lvs. $\frac{1}{4}$ –3 in. below the floral spike: calyx-teeth of upper lip at least as long as broad.

B. Lvs. cuneate or rounded at base, scarcely if at all toothed.....1. *P. grandiflora*

BB. Lvs. truncate-cordate at base, strongly toothed.....2. *P. hastæfolia*

AA. Upper foliage lvs. adjacent to spike: middle upper calyx-tooth not more than half as long as broad.....3. *P. vulgaris*

1. *P. grandiflora*, Jacq. (*P. vulgaris* var. *grandiflora*, L.). Sts. to $1\frac{1}{2}$ ft. high, somewhat pilose: lvs. lance-ovate, 1–3 in. long, entire or slightly toothed, scattered-pilose, petioled: spikes $1\frac{1}{2}$ –2 in. long; calyx $\frac{1}{2}$ in. long, ciliate; corolla almost glabrous, purple, 1 in. long. Eu.

2. *P. hastæfolia*, Brot. Like *P. grandiflora* but lvs. ovate-hastate with truncate-cordate base and well-developed broad rounded teeth especially near base: corolla slightly longer, more inflated at throat. Spain and Portugal.—*P. Webbiana*, Hort., is near this species.

3. *P. vulgaris*, L. HEAL-ALL. SELF-HEAL. Sts. to 2 ft., often procumbent, more or less pubescent: lvs. ovate-oblong, entire or toothed, 1–3 in. long, petioled: spikes to $1\frac{1}{2}$ in. long; calyx about $\frac{1}{4}$ in. long; corolla purple or violet, $\frac{1}{2}$ in. long. Eu., Asia, N. Amer.—White-fl. forms are var. *leucantha*, Schur, pink-fl. ones var. *rubrifolia*, Beckhaus.

11. **PHYSOSTEGIA**, Benth. FALSE DRAGONHEAD. Per. herbs native to N. Amer., grown in borders and in wild-gardens for their showy fls.; about 5 species.—Erect plants almost glabrous, with slender wand-like sts.: lvs. lanceolate to oblong, toothed or serrate, the upper sessile, the lowest tapering into a petiole; floral lvs. small and bract-like, mostly shorter than the calyx: floral whorls 2-fl.; calyx nearly regular and equally 5-toothed; corolla purple, rose or white, the tube gradually inflated upward, the lips short; stamens 4; style 2-cleft: nutlets 3-angled, smooth. (Physostegia: Greek bladder and covering, referring to the inflated fruiting calyx.)

P. virginiana, Benth. (*P. virginica*, Fisch. *Dracocephalum virginianum*, L.). Sts. leafy, simple, terminated by a single virgate or sometimes several panicked spikes, to 4 ft. high, forming large clumps in cult.: lvs. oblong to lanceolate, 3–5 in. long, serrate, acuminate; floral lvs. bract-like, lanceolate: infl. finely puberulent; calyx-teeth acuminate; corolla

$\frac{3}{4}$ –1 in. long, purplish-red to rose-pink or lilac; flowering in summer. Que. west and south. Var. *alba*, Hort., fls. white. Var. *grandiflora*, Hort., fls. bright pink, on longer infl.

12. **LEONOTIS**, R. Br. **LIONS-EAR**. About 12 species in trop. and S. Afr., one planted for ornament in the S.—Ann. or per. herbs or shrubs: lvs. ovate to lanceolate, petioled or subsessile; fls. white to orange, in very dense axillary whorls; calyx 8–10-ribbed, the tube arched and funnel-shaped, the teeth often acrose-tipped; corolla-tube as long as calyx or longer, upper lip long and concave, hairy outside, lower lip deflexed, shorter, the 3 lobes nearly equal; stamens 4, arched; style 2-lobed. (Leono-tis: Greek *lion's ear*, which the fls. are supposed to resemble.)

L. Leonurus, R. Br. Shrubby branched per. 3–6 ft. high, with hairy sts. (a dwarf form not over 2½ ft. high): lvs. lanceolate or oblong-lanceolate, 2–5 in. long, acute to nearly obtuse, coarsely serrate, narrowed at base, pubescent; bracts nearly as long as calyx-tube; corolla 1½–2 in. long, more than three times the length of calyx, red-yellow or orange-red (in one form white), the upper lip large and elongate, densely hirsute, the lower small; stamens not exerted. (Leonurus: Linnæan name for the genus under which this species was formerly included: Greek *lion's tail*.) S. Afr.

13. **PHLOMIS**, L. A few of the 70 species are cult. in wild-gardens, native Medit. region to China.—Shrubs or per. herbs, often more or less woolly: lvs. all similar or the upper bract-like: whorls few- to many-fld., the fls. sessile; calyx regular, truncate or 5-toothed; upper lip of corolla densely hairy, erect or curving over the lower lip, lower lip spreading, with 3 rounded lobes; corolla-tube often with a hairy ring inside; stamens 4, one pair of filaments often appendaged at base; style 2-lobed: nutlets 4, ovoid and 3-angled, glabrous or pubescent. (Phlo-mis: old Greek name.)

A. Fls. yellow: a shrub.....1. *P. fruticosa*
AA. Fls. purple: an herb.....2. *P. tuberosa*

1. **P. fruticosa**, L. **JERUSALEM-SAGE**. Divaricately branched shrub 2–4 ft. high, branches floccose-woolly: lvs. ovate or oblong, entire or crenate, rounded or cuneate at base, rugose, white-tomentose beneath; floral lvs. subsessile, scarcely longer than the dense many-fld. floral whorls which are borne singly or in 2's at the ends of the branches; bracts ovate to ovate-lanceolate, mostly surpassed by the calyx; corolla yellow, conspicuous; blooming in summer in the E., in winter in warm climates. S. Eu.

2. **P. tuberosa**, L. Subglabrous herb 3–6 ft. high, with thickened tuber-like roots: lvs. broad-ovate, obtuse, crenate, deeply cordate at base, lower long-petioled and 8 in. or more long; floral lvs. oblong-lanceolate, coarsely serrate-toothed, at base often hastate-dilated and subincised, 2–3 in. long; floral whorls remote, 30–40-fld., bracts subulate; calyx-teeth emarginate, tipped with a rigid spine; corolla purple, upper lip suberect, densely pilose within. S. Eu., E. and N. Asia.

14. **LAMIUM**, L. **DEAD NETTLE**. Low ann. or per. herbs, one or two sometimes cult. as border plants, the 40 species being native to the Old World.—Commonly diffuse or decumbent at base: lvs. mostly crenate-dentate and petiolate; fls. often rather showy, in axillary or terminal whorls; bracts short; calyx awl-toothed; corolla 2-lipped, the tube somewhat longer than calyx, upper lip ascending and concave, lower one 3-lobed; stamens 4, in 2 pairs, ascending under the upper lip. (La-mium: Greek for *throat*, referring to the shape of the corolla.)

L. maculatum, L. (*L. variegatum*, Hort.). Straggling or half-trailing per., slightly hairy, tips of the branches ascending: lvs. long-petioled (except the uppermost), cordate-ovate, 1–2 in. long, obtuse, crenate-dentate, in one var. whitish-blotched along the midrib: fls. appearing in spring and summer, usually purple-red, sometimes varying to white, 1 in. long, ascending in the clusters; corolla-tube two to three times as long as calyx, hairy within, upper lip strongly arched or hooded. Eu.

15. **MOLUCELLA**, L. Two species of the Medit. region, sometimes found in old-fashioned gardens.—Ann. herbs with petiolate lvs. toothed or cut: fls. axillary, borne in whorls of 6–10; bracts subulate, spinose; calyx campanulate, the limb broadly dilated; corolla white, tipped pink, scarcely if at all thrust out of the calyx, the tube with oblique hairy ring within, the upper lip erect, the lower trilobed with broad notched middle lobe; stamens 4, ascending under the hood, the anthers attached by lateral pedicels to the tip of the filament, the cells divergent; style bifid: nutlets 4, convex on one side, angular on the other, broader upward, truncate. (Molucel-la: diminutive of Molucca.)

M. lævis, L. SHELL-FLOWER (so-called because of the shell-like calyx in which the seeds nestle like eggs). MOLUCCA-BALM. Sts. simple or branching below, 2-3 ft. high, fl.-bearing almost from base: lvs. long-petioled, rounded-subcordate, $\frac{3}{4}$ -1 $\frac{1}{4}$ in. long, with coarse rounded teeth: fls. fragrant, in 6-fld. whorls; bracts shorter than calyx-tube; calyx with large spreading membranaceous border, inconspicuously 5-angled, with 5 small thorns; corolla white, shorter than calyx. W. Asia.—Sometimes called "Bells of Ireland."

16. STACHYS, L. BETONY. WOUNDWORT. Probably 200 species or more, in temp. regions but a few in the trop. and colder parts, a few sometimes cult. for economic or ornamental purposes.—Herbs or rarely shrubs: lvs. entire, crenate or dentate, the floral lvs. similar or reduced to bracts: floral whorls 2- to many-fld., axillary or in terminal spikes; fls. sessile or shortly pedicelled, purplish, scarlet, yellow, or white; calyx tubular-campanulate, 5-10-nerved, 5-toothed, very seldom 2-lipped; corolla-tube cylindric, included or exserted, bilabiate, the expanded lower lip 3-lobed; stamens 4: nutlets ovoid or oblong. (Sta-chys: old Greek name.)

A. Corolla short, included in calyx or very slightly exserted: lvs. densely silky-woolly.....1. *S. olympica*
AA. Corolla longer, the tube exserted.

B. Plant ann., procumbent: fls. pinkish-white.....2. *S. corsica*

BB. Plant per., erect: fls. purple to violet.

C. Lowest floral lvs. lanceolate: fls. $\frac{1}{2}$ in. long.....3. *S. officinalis*
CC. Lowest floral lvs. cordate-ovate: fls. 1 in. long.....4. *S. grandiflora*

1. *S. olympica*, Poir. (*S. lanata*, Jacq. not Crantz nor Moench). LAMBS-EARS. Per. 1-1 $\frac{1}{2}$ ft. high, very densely silky-woolly throughout: lvs. petiolate, oblong-elliptic, narrowed at both ends, minutely crenate, rugose; floral lvs. smaller, sessile or nearly so, the uppermost scarcely longer than the fls.: floral whorls many-fld., the uppermost close together, the lower distant; bracts linear-lanceolate, about equalling the calyx; calyx with slightly unequal teeth; corolla purple, about $\frac{1}{2}$ in. long, lanate without, the tube not exserted from the calyx. Caucasus to Iran.

2. *S. corsica*, Pers. Dwarf prostrate ann. forming a dense carpet, pubescent: lvs. bright green, ovate, $\frac{1}{2}$ in. long, very obtuse, crenate: fls. pinkish-white, $\frac{1}{2}$ in. long, very numerous, lips large. Corsica, Sardinia.

3. *S. officinalis*, Franch. (*S. Betonica*, Benth. *Betonica officinalis*, L.). Per. 1-3 ft. high, somewhat pilose: lower lvs. long-petioled, ovate-oblong, obtuse, crenate, cordate at base, the upper remote; lower floral lvs. sessile, oblong-lanceolate, toothed, acute, the upper linear, entire, equalling the calyx: floral whorls arranged in an oblong spike, somewhat interrupted or the lower distinct; bracts ovate, mucronate; corolla purple, $\frac{1}{2}$ in. long, twice the calyx, the tube naked within; summer. Eu., Asia Minor.—There are vars. with white and rose-colored fls.

4. *S. grandiflora*, Benth. (*S. rosea*, Hort. *Betonica grandiflora*, Willd. *B. rosea*, Hort. *B. spicata*, Hort.). Villous per. about 1 ft. high: lvs. long-petioled, broadly ovate, obtuse, crenate, broadly cordate at base; floral lvs. similar, sessile, amplexicaul, successively smaller, the uppermost bract-like: floral whorls few, 10-20-fld., distinct, the lower remote; outer bracts similar to the floral lvs., the inner narrower, entire; calyx purplish, with rigid subulate subspinose teeth; corolla violet, glabrous, the curving tube about 1 in. long and three to four times surpassing the calyx. Asia Minor.—Vars. occur with rose-pink or purple-violet fls.

17. COLQUHOUNIA, Wall. Shrubs cult. to some extent in the S., the entire genus comprising only 2-4 species native to S. Asia.—Erect or loosely twining, at least the younger parts tomentose: lvs. large, crenate, the floral ones similar or above reduced and bract-like: fls. scarlet, borne in loose few-fld. whorls, these axillary or in a dense terminal spike or raceme; bracts small; corolla-tube exserted, incurved; stamens 4, the anther-cells confluent: nutlets produced at the apex into wings. (Colquhou-nia: after Sir Robt. Colquhoun; lived 100 years ago.)

C. vestita, Wall. Erect plant to about 4 ft., permanently white-woolly: lvs. elliptic or elliptic-ovate, 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ in. long: orange-scarlet fls. appearing in autumn and winter; calyx-teeth acute; corolla $\frac{3}{4}$ in. long.

18. SALVIA, L. SAGE. A vast genus with upward of 700 species, widely distributed in the temp. and warmer regions of both hemispheres, furnishing many ornamental subjects and a few grown for culinary or medicinal purposes.—Ann., bien., or per. herbs, subshrubs, and shrubs: lvs. entire, variously toothed, incised or pinnatisect; floral lvs. frequently small and bract-like, rarely similar to the cauline: fls. variously colored, rarely yellow, of various sizes, in 2- to many-fld. verticels or

whorls, spicate, racemose, paniculate or rarely all axillary; calyx commonly 2-lipped, the upper lip entire or 3-toothed, the lower 2-cleft; corolla-tube included or exerted, the limb 2-lipped; stamens inserted on the throat of the corolla, only the lower pair fertile, the upper pair rudimentary or lacking; anther-cells widely separated on a long slender connective articulated with the filament, the upper end of the connective bearing a perfect anther-cell, the lower end usually with an imperfect one or none: nutlets ovoid, 3-edged or somewhat compressed, smooth. (Sal-via: Latin name, used by Pliny, meaning *safe, unharmed*, referring to the medicinal properties of some of the species.)

- A. Fls. $1\frac{1}{2}$ -2 in. long.
 B. Sts. densely pubescent: fls. blue.....13. *S. patens*
 BB. Sts. glabrous except in infl.: fls. usually red.....20. *S. splendens*
 AA. Fls. not over 1 in. long.
 B. Lf.-blades usually $\frac{1}{2}$ -1 in. long: fls. red, 1 in. long.
 C. Lvs. mostly obovate, entire: branches with recurved hairs.....15. *S. Greggii*
 CC. Lvs. ovate to elliptic, crenulate-serrate: branches with erect hairs.....18. *S. microphylla*
 BB. Lf.-blades longer.
 C. Lvs. more or less white-woolly.
 D. Plants thistle-like, with spiny teeth: fls. lavender, with vermilion anthers.. 1. *S. carduacea*
 DD. Plants not thistle-like.
 E. Length of lf. $1-2\frac{1}{2}$ in.
 F. Height 1-2 ft.: calyx definitely 2-lipped..... 4. *S. officinalis*
 FF. Height 3-4 ft.: calyx spathe-like, the teeth wholly united into a single cucullate lip..... 2. *S. leucophylla*
 EE. Length of lf. $2\frac{1}{2}$ -7 in.
 F. Corolla $\frac{1}{2}$ in. long; racemes nodding.....11. *S. nutans*
 FF. Corolla $\frac{3}{4}$ in. long; racemes erect.
 G. Lf. sinuate-lobed, broadly ovate..... 7. *S. argentea*
 GG. Lf. crenate, lance-linear.....19. *S. leucantha*
 CC. Lvs. not at all white-woolly.
 D. Foliage pinnatisect into linear segms.....12. *S. Jurisicii*
 DD. Foliage not pinnatisect.
 E. Upper st.-lvs. sessile.
 F. Lower st.-lvs. largely sessile; lf.-blades 1-3 in. long..... 9. *S. superba*
 FF. Lower st.-lvs. petioled; lf.-blades 2-6 in. long.
 G. Infl. glandular; fls. 1 in. long..... 8. *S. pratensis*
 GG. Infl. not glandular; fls. $\frac{1}{2}$ in. long.....10. *S. Tenorii*
 EE. Upper st.-lvs. petioled.
 F. Floral lvs. large, persistent, the uppermost purple, red, or white.
 G. Blades of lvs. $1-1\frac{1}{2}$ in. long, obtuse or cuneate at base: calyx tubular..... 5. *S. Horminum*
 GG. Blades of lvs. 4-9 in. long, cordate at base: calyx campanulate... 6. *S. Sclarea*
 FF. Floral lvs. small, often early deciduous, rarely colored.
 G. Corolla red, $\frac{3}{4}$ -1 in. long; fls. in verticels of mostly 3-6.....14. *S. coccinea*
 GG. Corolla bluish to white, $\frac{3}{8}$ - $\frac{3}{4}$ in. long; fls. more numerous.
 H. Lf. sinuate-crenate to lyrate-pinnatifid: floral whorls remote.... 3. *S. verticillata*
 HH. Lf. entire to serrate: floral whorls crowded at least during anthesis.
 I. Calyx white to purplish with dense tomentum: floral lvs. mostly deciduous.....16. *S. farinacea*
 II. Calyx grayish-green, finely puberulent: floral lvs. persistent.. 17. *S. azurea*

1. *S. carduacea*, Benth. THISTLE SAGE. Loosely tomentose thistle-like ann. 1-2 ft. high; sts. scape-like, erect; lvs. oblong, sinuate-pinnatifid, spinulose-toothed, 3-6 in. long, in a basal cluster: whorls densely many-fld., head-like, $1-1\frac{1}{2}$ in. diam., single or few and remote, subtended and commonly surpassed by a cluster of lanceolate or ovate-lanceolate spinose-toothed bracts giving it a carduus-like or thistle-like appearance; calyx white with long wool, the throat villous, the upper lip 3-toothed and much surpassing the lower, the teeth all spinose-tipped; corolla lavender or bluish-purple, 1 in. long, with a hairy ring inside and with 2-lobed upper and 3-lobed lower lip, the lowest lobe elongate and deeply fringed; connectives directed forward, the anterior portions remote and bearing fertile anther-cells. Calif., where it blooms in spring as a winter ann., especially southward.

2. *S. leucophylla*, Greene (*Audibertia nivea*, Benth.). Hoary throughout with close tomentum, 3-4 ft. high, shrubby below, leafy: lvs. oblong-lanceolate or the lowest ovate, obtuse, 1-2 $\frac{1}{2}$ in. long, the upper very short-petioled with truncate base; bracts oval or oblong, obtuse: calyx splitting down the front, finally emarginate on the back; corolla light purple, over $\frac{1}{2}$ in. long, the tube only slightly surpassing the calyx; stamens and style long-exserted; connective of stamens almost continuous with filament. Calif.

3. *S. verticillata*, L. Erect per. 2-3 ft. high, more or less pilose-hispid throughout: lvs. petioled, broadly ovate, at base cordate or lyrate-pinnatifid, sinuate-crenate, barely acute, 2-6 in. long: whorls few to many, densely many-fld., remote, subtended by small bract-like deflexed floral lvs.; calyx with short setaceous-acuminate teeth; corolla lilac-blue, about $\frac{3}{4}$ in. long, with a hairy ring inside; connectives very short, deflexed and subulate but remote anteriorly; summer and autumn. Eu., Asia Minor and Caucasus region.

4. *S. officinalis*, L. SAGE. Subshrub $\frac{1}{2}$ –2 ft. high, more or less white-woolly: lvs. petioled, oblong, 1–2 in. long, entire or finely crenate, acute or obtuse, rugose; floral lvs. sessile, ovate to ovate-lanceolate, often acuminate; racemes nearly simple, the fl.-whorls rather few, interrupted, many-flid.; calyx membranaceous, purplish-tinged, campanulate, the 2 lower teeth longer than the 3 upper, all subulate-acuminate; corolla $\frac{1}{2}$ – $\frac{3}{4}$ in. long, purple, blue or white, with a hairy ring inside; in summer. *Medit. region.*—Vars. are offered with lvs. variegated with yellow, white or red.

5. *S. Horminum*, L. Erect ann., about $1\frac{1}{2}$ ft. high, more or less villous throughout: lvs. shortly petiolate, oblong to ovate, crenulate, obtuse or cuneate at base, 1–2 $\frac{1}{2}$ in. long; floral lvs. very broadly ovate, sessile and acute, nearly as long as fls., the upper colored or sometimes white; racemes simple, the whorls distant and about 6-flid.; calyx tubular, shortly bilabiate, the upper lip with 3 small unequal teeth, the lower 2-cleft; corolla light lilac or pale violet to reddish-violet or purple, about $\frac{1}{2}$ in. long, without a hairy ring inside; anterior portion of connectives deflexed, abruptly dilated, connected at the extremity; summer. (*Horminum*: old Greek name, adopted by Linnæus.) S. Eu.

6. *S. Sclarea*, L. CLARY. Erect bien. 2–3 ft. high, with stout villous sts. glandular above: lvs. hairy, 4–9 in. long, broadly ovate, mostly cordate at base, petiolate, crenate or toothed; floral lvs. very broad, abruptly acuminate, surpassing the glandular calyx, colored, their bases white, tips rose; racemes paniced, the fl.-whorls distant, about 6-flid.; calyx broadly campanulate, upper lip 3-toothed, lower 2-cleft, teeth somewhat spiny-acuminate; corolla whitish-blue varying to rose and purplish, to 1 in. long, without a hairy ring inside, tube not exerted from calyx; anterior portion of connectives deflexed, abruptly dilated, connected at the extremity; late summer. (*Sclarea*: Latin for *clear*, *bright*, in reference to the color of the fls., an ante-Linnæan name.) S. Eu. Var. *turkestaniana*, Mott. (*S. turkestanica*, Hort.), involucre bracts to twice as long as calyces or more; fls. white tinged pink; Turkestan.

7. *S. argentea*, L. Bien. 2–4 ft. high, with erect villous herbaceous sts.: basal and lower st.-lvs. white-woolly, 2–6 in. long, broad-ovate, sinuate-lobed, the lobes erose-crenate; floral lvs. very broad; panicles divaricate-branched; fl.-whorls remote, 6–10-flid., the uppermost fls. abortive; calyx campanulate, the teeth all subspinose; corolla showy, rose-white, whitish, purplish, or yellowish, about $\frac{3}{4}$ in. long, without a hairy ring inside, the upper lip much longer than the lower; anterior portion of connectives deflexed, abruptly dilated, connected at extremity; summer. *Medit. region.*

8. *S. pratensis*, L. Herbaceous per. 1–3 ft. high, with root sometimes tuberous and sts. erect, pubescent: lvs. more or less blood-red spotted; basal lvs. petiolate, oblong-ovate, 2–6 in. long, obtuse, crenate or incised, cordate at base, rugose, glabrous above, pubescent beneath along the petiole and nerves, only upper sessile; floral lvs. cordate-ovate, green; racemes nearly simple, viscid, the whorls distant and 6-flid., pedicels shorter than calyx; calyx almost sessile, campanulate, viscid-villous; corolla bright blue, rarely reddish or white, 1 in. long, without a hairy ring inside; anterior portion of connectives deflexed, abruptly dilated, connected at the extremity; summer. Eu.—Numerous vars. are offered whose fls. range from violet to purple, red, light blue, or white, or sometimes variegated. *S. silvestris*, L., also with lower st.-lvs. petioled, has fls. about $\frac{1}{2}$ in. long and floral bracts purple-red.

9. *S. superba*, Stapf (*S. nemorosa*, Mott. not L. *S. virgata*, Hort. not Ait. *S. virgata* var. *nemorosa*, Hort.). Much-branched per. 2–3 ft. high, sts. roughish-pubescent: lvs. lanceolate to oblong, crenate, obtuse or acute, glabrous and rugose above, somewhat pubescent beneath, the basal short-petioled, cauline sessile and often clasping; floral lvs. ovate, acuminate, shorter than or about equalling the calyx; racemes long, slender, terminating the branches, the many whorls 6-flid., distinct; calyx purplish, hairy, resinous-dotted, 2-lipped, upper lip shortly and sharply 3-toothed, lower with 2 longer acerose-tipped teeth; corolla bright violet or purple, $\frac{3}{8}$ – $\frac{1}{2}$ in. long, without a hairy ring inside, swollen at the throat, tube little or not at all exerted, limb more or less profusely resinous-dotted; anterior portion of connectives deflexed, abruptly dilated, connected at the extremity; summer and autumn. Hybrid of *S. silvestris* and *S. villicaulis*.

10. *S. Tenorii*, Spreng. (*S. pratensis* var. *Tenorii*, Hort.). Per. with erect sts. paniculate-racemose above, short pilose-hispid, not glandular in infl.: lvs. short-pilose beneath, ovate, double-crenate, cordate or obtuse at base, 3–6 in. long; upper st.-lvs. half-clasping; floral lvs. cordate-ovate, acuminate, less than one-fourth the pilose calyx; corolla dark blue, $\frac{3}{8}$ – $\frac{1}{2}$ in. long. (M. Tenore, page 52.) N. E. *Medit. region.*—By some treated as conspecific with the older *S. hæmatodes*, L.

11. *S. nutans*, L. Per., sts. puberulent, to 3 ft., paniculate-branched above: lvs. crowded toward base of sts., long-petioled, cordate-ovate, rugose, doubly crenate, appressed white-woolly beneath, 4–7 in. long; racemes slender, nodding in bud, with crowded whorls; floral bracts minute; calyx hirsute; corolla bright blue to violet, $\frac{1}{2}$ in. long, with straight upper lip. S. E. Eu.

12. *S. Jurisicii*, Kosanin. Per., sts. bristly, pilose, simple or branched, to $1\frac{1}{2}$ ft.: lvs. to 4 in. long, glabrous except for ciliate margins, 1–2-pinnatisect into linear-oblong segms.; uppermost lvs. entire, linear-lanceolate; whorls 2–4-flid.; calyx pilose; corolla deep blue, pilose, $\frac{1}{4}$ in. long. (Named for Jurisici, who sent the plant to Kosanin.) Serbia.

13. *S. patens*, Cav. Per. 1-2½ ft. high, rather densely clothed with stiffish often viscid hairs: lvs. ovate or oblong-ovate, 2-5 in. long, hastate or rounded and subcordate at base, crenulate, obtuse, the lower long-petioled, the upper subsessile; floral lvs. surpassing the calyx: whorls 2- to few-fld.; calyx campanulate, with setaceous-acuminate teeth, the upper lip often 3-cuspidate; corolla blue, 1½-2 in. long, without hairy ring inside; anterior portion of connectives deflexed, linear; early autumn. Mts. of Mex.

14. *S. coccinea*, Juss. (*S. rosea*, Vahl). Ann. or sometimes per. and subshrubby, 1-2 ft. high, more or less pubescent or towards the base hirsute with long spreading hairs: lvs. ovate or deltoid, 1-2 in. long, mostly acute, crenate, on long slender petioles; floral lvs. ovate, acuminate-setaceous, seldom equalling the calyx: racemes virgate, clusters few- to several-fld. and rather distant; calyx tubular-campanulate, upper lip entire, often purplish, lower 2-parted, all the teeth acute; corolla deep scarlet, ¾-1 in. long, without a hairy ring inside, the narrow tube moderately enlarging above, the lower lip twice as long as upper; anterior portion of connectives deflexed, linear; summer. S. C. to Fla. and Tex., Mex., W. Indies, and trop. Amer.—Not to be confused with *S. splendens*. Fls. varying to white.

15. *S. Greggii*, Gray. Half-shrub to 3 ft., with slender branches, glabrous or the sts. obscurely mealy-puberulent: lvs. petiolate, ½-1 in. long, oblong or spatulate, entire, obtuse or mucronate, fascicled, 1-nerved: racemes loosely few-fld., the ovate floral lvs. falling before the fls. open; calyx narrow-campanulate, upper lip entire, lower 2-parted, all the teeth acute; corolla red or purplish-red, 1 in. long, without a hairy ring inside, the exserted portion of tube strongly swollen, lower lip large and showy; anterior portion of connectives deflexed, linear; autumn. (Named for Dr. Josiah Gregg, who collected this species in Saltillo, Mex.) Tex. and Mex.

16. *S. farinacea*, Benth. Minutely puberulent per. 2-3 ft. high, with numerous clustered sts.: lvs. often somewhat fascicled, 1½-3 in. long, the lower ovate-lanceolate to ovate, coarsely and irregularly serrate, obtuse or acute at apex, at base obtuse or narrowed to slender petiole; upper lvs. lanceolate or linear-lanceolate; floral lvs. mostly caducous: whorls numerous, many-fld., rather close or the lower remote; calyx oblong-campanulate, white or purplish-tinged with soft dense tomentum, the 3 teeth broad and very short; corolla violet-blue, ½-¾ in. long, without a hairy ring inside; anterior portion of connectives deflexed, linear. Tex.—Probably including some of the material offered as *S. azurea* var. *grandiflora*.

17. *S. azurea*, Lam. Glabrous or puberulent per. with hairs appressed upward, branching, 1-6 ft. high: lvs. lanceolate to oblong or linear, obtuse or acute, tapering to a very short petiole, 2-4 in. long, serrate or the upper entire; floral lvs. subulate, small, persistent: infl. elongate, spike-like, composed of numerous many-fld. whorls rather close or the lower remote; calyx oblong-campanulate, ½ in. long, short-bilabiate, the upper lip very broad and obtuse, the lobes all similar; corolla deep blue varying to white, ⅝-¾ in. long, without a hairy ring inside; anterior portion of connectives deflexed, linear; summer. S. C. to Fla. and La. Var. *grandiflora*, Benth. (*S. Pitcheri*, Torr.), sts. densely retrorse-pubescent; Mo. and Neb. to Tex.

18. *S. microphylla*, HBK. (*S. Grahamii*, Benth.). Shrub to 3 ft., diffusely branched, sts. rounded, short-pubescent: lvs. deltoid-ovate to elliptic, ½-1 in. long, mostly crenulate-serrate, petioled: fls. in open racemes, red; calyx ½ in. long; corolla almost 1 in. long, glan-dular-puberulent toward tip. Mex.

19. *S. leucantha*, Cav. Shrub about 1½-2 ft. high, branches subterete and white with finally deciduous wool: lvs. short-petioled, 2-6 in. long, lanceolate-linear, acute, crenate, rugose, pubescent above, tomentose beneath; floral bracts ovate, acuminate, shorter than calyx, deciduous: racemes 6-10 in. long, whorls many-fld., the lower rather remote; calyx funnel-shaped, with about equal lobes, densely violet to lavender-lanate; corolla white, ⅝-¾ in. long, swollen at throat, without a hairy ring inside, limb lanate with upper lip much exceeding lower; anterior portion of connectives deflexed, linear; summer. Mex.

20. *S. splendens*, Sello (*S. colorans*, Hort.). SCARLET SAGE. Herb or subshrub, 3 ft. high, glabrous or the infl. villous with colored hairs, cult. as an ann. for its masses of brilliant scarlet fls. which bloom in autumn: lvs. petioled, ovate, 2-3½ in. long, acuminate, dentate; floral lvs. and bracts ovate, acuminate, colored: racemes terminal, simple or paniced, the whorls 2-6-fld.; calyx campanulate, scarlet, with 3 broad-ovate acute teeth; corolla scarlet, glabrous or villous, 1½ in. long, without a hairy ring inside; anterior portion of connectives deflexed, linear. Brazil.—There are many vars. common in cult., the fls. varying in color from scarlet to purple, crimson, or even to white.

19. *PEROVSKIA*, Karel. Herbs or subshrubs valued chiefly for their late blue fls.; 4 species of W. and Cent. Asia.—Upright, aromatic when bruised: lvs. serrate to pinnatifid: fls. in distant whorls forming terminal spikes; bracts minute; calyx 2-lipped, tubular-campanulate, upper lip entire to tridentate, lower lip bidentate; corolla with short funnellform tube, upper lip 4-lobed, lower lip entire, deflexed;

fertile stamens 2. (Perovskia: named for V. A. Perovski, 1794–1857, once governor of Russian province Orenburg.)

P. atriplicifolia, Benth. Subshrub to 5 ft., with stellate-hoary sts.: lvs. narrow-ovate to lanceolate, 1–2½ in. long, serrate, glabrescent, short-petioled: fls. blue, 2–6 to a whorl, in paniculate infl.; calyx hoary or purplish, ¼ in. long; corolla ⅜ in. long. W. Himalayas.

20. MONARDA, L. HORSE-MINT. N. American genus, several of the 17–18 species occasionally grown for their showy fls.—Erect aromatic ann. or per. herbs, usually tall: lvs. dentate or serrate: fls. rather large, white, red, purplish, yellowish or mottled, in dense capitate clusters, terminal or sometimes axillary, mostly bracteate, the bracts often highly colored; calyx tubular, narrow, 15-nerved, almost equally 5-toothed, more or less villous or hirsute at the mouth; corolla glabrous within, tube slightly dilated above, upper lip erect or arched, lower lip spreading, 3-lobed with middle lobe largest; perfect stamens 2, usually exserted, the posterior pair rudimentary or wanting, anthers linear; ovary 4-parted. (Monarda: after Nicholas de Monardes, Spanish physician and botanist, 1512–1588, who in 1571 published a book containing accounts of American products.)

A. Calyx slightly hairy at throat: sts. acutely angled.....1. *M. didyma*
AA. Calyx densely bearded at throat: sts. mostly obtusely angled.....2. *M. fistulosa*

1. ***M. didyma*, L. (*M. coccinea*, Hort.).** OSWEGO-TEA. BEE BALM. FRAGRANT BALM. Villous-hirsute becoming glabrous, sts. acutely 4-angled: lvs. thin, ovate to ovate-lanceolate, to 6 in. long, acuminate: bracts tinged with red; calyx slightly hirsute in the throat, the teeth narrowly subulate; corolla nearly glabrous, scarlet-red, 1½–2 in. long; late summer or early autumn. Que. to Mich. south to Ga.—Many color variants occur, such as vars. *rosea*, *salmonea*, *violacea*, Hort.

2. ***M. fistulosa*, L. WILD BERGAMOT.** Soft-pubescent to glabrate, sts. mostly obtusely angled: lvs. to 4 in. long, firmer than in *M. didyma*: bracts whitish or rarely purplish, the inner mostly hirsute-ciliate: calyx conspicuously and densely bearded at throat; corolla pubescent, at least on the upper lip, purple or purplish dotted, 1 in. or more long; late summer and early autumn. Ont. and Que. to Fla. and Tex. west to B. C. and Ariz. Var. *alba*, Hort., has white fls.—Crimson, lilac, or deep-purple-fl. forms occur.

21. HORMINUM, L. A per. herb from S. Eu., adapted to the rock-garden.—Lvs. mostly in basal rosettes, ovate to broadly elliptical, obtusely dentate, petioled: fls. in whorls of 2–6, arranged in leafless spikes; calyx 13-nerved, deeply 2-lipped, the upper lip with 3 sharp-pointed lobes, lower 2-lobed; corolla bluish-purple, tube broad and exceeding the calyx, upper lip almost flat, scarcely toothed, lower 3-lobed; stamens 4. (Horminum: ancient Greek name for some sage.)

H. pyrenaicum, L. Lf.-blades 1–2½ in. long: spikes 3–12 in. high, glandular-pubescent and strigose; fls. about ⅝ in. long.

22. MELISSA, L. Known in cult. from a single species with lvs. having a lemon-like flavor and used in seasoning, particularly in liqueurs, and also as a medicine; 3–4 species of the Medit. region and Cent. Asia.—Erect per. herbs, with leafy branched sts.: lvs. broad, toothed: fls. white or yellowish, in axillary clusters; corolla exserted from the long-campanulate calyx, curved, enlarged above and naked within, 2-lipped, the upper lip erect and notched, the lower spreading and 3-lobed; stamens 4, ascending and approximate under the upper lip; style cleft at apex: nutlets smooth. (Melissa: Greek *bee*.)

M. officinalis, L. LEMON BALM. BEE BALM. Aromatic herb loosely branched, somewhat hairy, 1–2 ft. high: lvs. ovate, to 3 in. long, petioled, narrowed or cordate at base, coarsely crenate-dentate: fls. yellowish or whitish, appearing in late summer; calyx 2-lipped, the upper lip shortly and broadly 3-toothed, the lower with 2 longer acuminate-spinose teeth; corolla ½ in. long.

23. SATUREJA, L. SAVORY. Aromatic herbs and subshrubs grown in borders and also as pot-herbs; about 180 species in the warmer regions of both hemispheres.—Lvs. narrow and entire or broader and toothed; floral lvs. similar or sometimes smaller: fls. in few- to many-fl. whorl-like cymes, the infl. simple and subspicate, more or less racemose-paniculate; calyx tubular-campanulate or tubular, 5-toothed or sometimes 2-lipped; corolla-tube short or long, exserted or scarcely so, upper lip

flat and entire or emarginate, lower lip expanded, 3-cleft; stamens 4: nutlets ovoid, smooth. (Sature-ja: old Latin name for savory; letter *j* pronounced as *i*.)

- A. Lvs. suborbicular or ovate, subserrate, not more than twice as long as wide, distinctly petioled.
 B. Calyx-lobes linear-lanceolate: sts. 4-8 in. high.....1. *S. alpina*
 BB. Calyx-lobes short-deltoid: sts. 8-18 in. high.....2. *S. thymifolia*
 AA. Lvs. mostly lanceolate to linear, entire, sessile or nearly so.
 B. Sts. glabrous or pubescent only in lines, distinctly 4-angled; corolla purple.....3. *S. subspicata*
 BB. Sts. pubescent, subterete; corolla usually paler.
 C. Plant a subshrub with minutely pubescent branches; opposite lf.-bases joined by a ridge.....4. *S. montana*
 CC. Plant an ann. with densely white-pubescent branches; opposite lf.-bases not joined by a ridge.....5. *S. hortensis*

1. *S. alpina*, Scheele (*Calamintha alpina*, Lam.). Diffuse per., pubescent or villous, much-branched and somewhat woody at base, about 6 in. high: lvs. petioled, subrotund or ovate, notover $\frac{1}{2}$ in. long, subserrate; floral lvs. sometimes narrower: floral whorls 4-6-fld., pedicels short; calyx ribbed, hairy in the throat, narrowed below the sharp rigid-tipped teeth; corolla purple, $\frac{1}{2}$ in. long, with strongly dilated throat. Medit. region.

2. *S. thymifolia*, Scop. (*S. rupestris*, Wulfen. *Micromeria rupestris*, Benth.). Aromatic subshrub to $1\frac{1}{2}$ ft.; branches slender, glabrous to minutely puberulent: lvs. ovate, $\frac{1}{4}$ - $\frac{3}{4}$ in. long, subentire to crenate-dentate, glabrous, petioled, glandular-punctate: fls. in several-fld. short cymes arranged in long racemes; calyx tubular, 13-nerved, glabrous to puberulent, lobes short-triangular; corolla white to violet, $\frac{1}{4}$ in. long. S. E. Eu.

3. *S. subspicata*, Bartling (*S. montana* var. *subspicata*, Vis. *S. pygmaea*, Sieber). Subshrub, mostly 3-8 in. high; branches sharply quadrangular, glabrous or with 2 bands of hair: lvs. crowded, linear-lanceolate to oblanceolate, $\frac{1}{2}$ -1 in. long, glandular-punctate beneath, sometimes ciliate, entire, subsessile: cymes 2-5-fld., in leafy crowded spikes; calyx tubular-campanulate, mostly purplish, 10-nerved, lobes about as long as tube, sharp-pointed; corolla purple-violet, $\frac{3}{8}$ - $\frac{1}{2}$ in. long. S. E. Eu.—Some of the material cult. as *S. pygmaea* belongs to *S. montana*.

4. *S. montana*, L. (*Calamintha montana*, Lam.). WINTER SAVORY. Glabrous or finely hispid subshrub, woody at base, 6-15 in. high, with minutely pubescent branches erect or ascending: lvs. hispid-ciliate, sessile, oblong-linear or oblanceolate, $\frac{1}{2}$ -1 in. long, entire, acute or the lower obtuse, pellucid-punctate; upper and floral lvs. narrower: floral whorls few- to many-fld., loosely racemose-paniculate; calyx and corolla resinous-dotted; throat of calyx bristly, teeth long-acuminate, shorter than tube; corolla white or lilac, $\frac{3}{8}$ in. long, tube little or not at all exerted. Eu., N. Afr.—Widely cult.

5. *S. hortensis*, L. (*Calamintha hortensis*, Hort.). SUMMER SAVORY. Ann. herb about $\frac{1}{2}$ - $1\frac{1}{2}$ ft. high, with rather densely pubescent erect branching sts.: lvs. oblong-linear, $\frac{1}{2}$ - $1\frac{1}{2}$ in. long, entire, acute, narrowed to a subsessile base or a short petiole; floral lvs. similar: floral whorls about 6-fld., in subspicate infl. which is dense above, interrupted and somewhat branched below; calyx resinous-dotted, teeth acuminate, hispid-ciliate, about as long as tube; corolla rose, $\frac{1}{8}$ in. long. Eu.; widely escaped from cult.

24. **HYSSOPUS**, L. Hyssop. A single species of Eu. and temp. Asia, grown for ornament in borders; also used for medicinal purposes and occasionally as a pot-herb.—Per. subshrub: lvs. entire: floral whorls in leafy-bracteate spikes; calyx tubular, 15-nerved; upper corolla-lip 2-lobed, the lower 3-lobed; stamens 4: nutlets ovoid and somewhat 3-sided, smooth. (Hyssopus: ancient name; but precisely what plant was the sacred hyssop of the Jews is uncertain.)

H. *officinalis*, L. Sts. herbaceous from a woody base, slender, $1\frac{1}{2}$ ft. high, simple or branching: lvs. linear to oblong, $1\frac{1}{2}$ -2 in. long, sessile or nearly so, acute at both ends or the lower obtuse at the apex: floral whorls secund, in terminal spikes; fls. blue or in some vars. red, rose or white; corolla exerted, $\frac{1}{3}$ - $\frac{1}{2}$ in. long; stamens and pistil well-exserted.

25. **ORIGANUM**, L. MARJORAM. About 6 species of per. herbs, one cult. for the aromatic herbage and purple-pinkish spikes of fls.; 5-7 species in the Medit. region.—Lvs. entire or toothed: fls. in small erect spikes with ovate or lanceolate green or colored bracts, the spikes more or less corymbosely or paniculately clustered; calyx ovate-campanulate, equally 5-toothed, with bearded throat; corolla with more or less exerted limb, upper lip erect, lower outspread and 3-lobed; stamens 4, exerted; style unequally 2-lobed: nutlets ovate, smooth. (Origanum: ancient Greek name, said to mean *delight of the mountains*.)—For the plant cult. as *O. Dictamnus* see *Amaracus Dictamnus*.

O. *vulgare*, L. WILD MARJORAM. Erect aromatic herb 1-2 $\frac{1}{2}$ ft. high, sts. more or less hairy, rootstocks nearly horizontal: lvs. petiolate, broadly ovate, to $1\frac{1}{2}$ in. long, subserrate

or entire, broadly rounded or subcordate at base, acute or blunt at apex: fls. in summer, purplish (varying to pink or nearly white), in corymbed clusters or short spikes; bracts purplish, glabrous, about the length of the calyx; corolla $\frac{1}{4}$ in. long; stamens all or only 2 exserted. Eu.—A var. has golden or yellow foliage.

26. **MAJORANA**, Moench. Per. herbs or undershrubs, chiefly of the Orient, with aromatic herbage; about 6 species, two in cult.—Mostly tomentose: lvs. entire or toothed: floral whorls in thick clustered spikes; bracts not colored, densely white-hairy; calyx-limb oblique, the lower lip small or poorly developed; corolla with short limb, the upper lip erect, the lower outspread, 3-lobed; stamens 4, exserted or included; style somewhat unequally 2-lobed: nutlets ovoid, smooth. (Majorana: derivation uncertain.)

A. Lvs. petioled 1. *M. hortensis*
AA. Lvs. sessile 2. *M. Onites*

1. *M. hortensis*, Moench (*Origanum Majorana*, L.). SWEET MARJORAM. ANNUAL MARJORAM. Per. 1–2 ft. high, cult. as an ann.: lvs. petiolate, elliptic, $\frac{1}{4}$ –1 in. long, entire, broadly obtuse, tomentose: spikelets oblong, 3–5 in a cluster; bracts not prominently colored; calyx oblique; corolla white to pink or pale lilac, $\frac{1}{6}$ in. long. Eu.

2. *M. Onites*, Benth. (*Origanum Onites*, L.). Per., sts. erect, nearly simple, hirsute: lvs. sessile, ovate, slightly serrate, villous or tomentose, mostly cordate at base: fls. as in *M. hortensis* but a little larger; spikelets ovoid, very numerous in a dense cluster. (Onites: ante-Linnæan substantive name.) S. E. Eu., Asia Minor, Syria.

27. **AMARACUS**, Gleditsch. A small genus of about 15 Medit. species of per. herbs, two cult. for their aromatic herbage and showy bracted infl.—By some authors combined with Origanum, but now quite universally retained by botanists as a distinct genus; separated from Origanum by the long-exserted stamens with widely divaricate anther-cells, the corolla gibbous to ventricose, and the calyx oblique and edentate. (Amarac-us: Greek *amaros*, meaning bitter.)

A. *Dictamnus*, Benth. (*Origanum Dictamnus*, L. *A. tomentosus*, Moench). CRETE DITTANY. Procumbent, white-woolly, sts. often ascending, to 1 ft. long: lvs. broadly ovate to orbicular, entire, thick, to $\frac{3}{4}$ in. long, somewhat mottled: fls. pink to purplish, $\frac{1}{2}$ in. long, subtended by large loosely imbricated bracts that become rose-purple in fr., arranged in hop-like heads. (Dictamnus: a genus of Rutaceæ.) Mts. of Greece.—A related plant of hybrid origin is *A. hybridus*, A. K. Jackson (*Origanum hybridum*, Mill.), presumably *A. Dictamnus* \times *A. sipyleus*, long known in cult.; stellate-hairy to pilose, much-branched, lvs. orbicular to ovate-elliptic, to $1\frac{1}{4}$ in. long and nearly 1 in. broad. By some authors this hybrid has been treated as a synonym of *A. sipyleus*, Brig. (*Origanum sipyleum*, L.), but this is a taller more slender mostly glabrous plant to 2 ft., lvs. narrowly ovate and those of the flowering sts. glabrous at flowering time.

28. **THYMUS**, L. THYME. Small shrubs or subshrubs used for edgings or for rockeries, or the shoots and lvs. sometimes employed for seasoning; species 50, more or less, widely dispersed in temp. climates, the greatest number native to the Medit. region.—Erect or prostrate, with strong mint-like odor: lvs. small, entire; floral lvs. similar or bract-like: floral whorls mostly few-fl., axillary and distant or gathered in short loose head-like terminal clusters; bracts minute; calyx ovoid or cylindric, 2-lipped, the broad upper lip 3-cleft or -toothed, the lower lip deeply cut into 2 small or subulate ciliate segms.; corolla-tube included or exserted, the limb somewhat 2-lipped; stamens 4: nutlets ovoid or oblong, smooth. (Thymus: old Greek name used by Theophrastus either for this plant or for savory.)

A. Lvs. sessile, with revolute margins 1. *T. vulgaris*
AA. Lvs. short-petioled, not revolute.
B. Shape of lvs. narrow-spatulate: calyx-tube not hairy 2. *T. azoricus*
BB. Shape of lvs. elliptic to ovate or lanceolate: calyx hairy.
C. Sts. covered with long white spreading hairs (as long as st. is thick).
D. Upper and lower surfaces of lf. hairy, $\frac{1}{2}$ in. long 3. *T. lanuginosus*
DD. Upper surface of lf. not hairy, $\frac{1}{2}$ – $\frac{1}{2}$ in. long 4. *T. laniacaulis*
CC. Sts. with very short mostly retrorse hairs.
D. Blade of lf. scarcely longer than wide: lower calyx-lobes lance-linear . . . 5. *T. nummularius*
DD. Blade of lf. more than twice as long as wide.
E. Lf. not resin-dotted above 6. *T. nitidus*
EE. Lf. resin-dotted on both surfaces.
F. Apex of lf. acute 7. *T. Herba-barona*
FF. Apex of lf. obtuse.

- g. Length of lvs. $\frac{1}{2}$ – $\frac{3}{4}$ in.: upper middle calyx-lobe longer than wide. 8. *T. Marshallianus*
 gg. Length of lvs. $\frac{1}{4}$ – $\frac{1}{2}$ in.: upper middle calyx-lobe about as long as wide. 9. *T. Serpyllum*

1. *T. vulgaris*, L. COMMON THYME. Suberect, 6–8 in. high, the slender branches stiff and woody, usually white-pubescent: lvs. sessile, linear to ovate, about $\frac{1}{4}$ in. long, fascicled; floral lvs. lanceolate to ovate; floral whorls loosely several- to many-fl., in rather dense head-like clusters on the branchlets or interrupted-racemose-clustered at the ends of the sts.; pedicels slender, about as long as calyx-tube; fls. resinous-dotted; calyx hairy in the throat, teeth of the upper lip lanceolate, of the lower lip subulate and ciliate; corolla lilac or purplish, tube little or not at all exserted. S. Eu.

2. *T. azoricus*, Lodd. (*T. micans*, Lowe). Compact, the flowering branches 1–2 in. high, retrorse-pubescent: lvs. narrow-spatulate, about $\frac{1}{4}$ in. long, resinous-punctate, glabrous except for the stiff-ciliate basal half: fls. in head-like clusters; calyx $\frac{1}{2}$ in. long, punctate, with subglabrous tube and ciliate lance-deltoid lower lobes; corolla $\frac{3}{4}$ in. long, resin-dotted and somewhat pubescent. Azores.

3. *T. lanuginosus*, Mill. (*T. Serpyllum* var. *lanuginosus*, Briq.). Flowering sts. 2–3 in. high, hairy all the way around: lvs. thickish, stiff, $\frac{1}{2}$ in. long, narrowly to broadly elliptic, covered with long stiff white hairs: fls. in heads; calyx thick-hairy, $\frac{1}{2}$ in. long, upper middle lobe as wide as long. N. Eu.—Much of the material cult. under this name has longitudinal bands of hair on the sts. and belongs to *T. britannicus*, Ronn., or other species.

4. *T. lanicaulis*, Ronn. Flowering branches 4–5 in. high, with spreading hairs at least as long as diam. of st.: lvs. elliptic, $\frac{1}{3}$ – $\frac{1}{2}$ in. long, glandular-punctate on both sides, glabrous above, hairy on midrib beneath, ciliate at least on basal half: fls. rose-pink, in globose heads; calyx villous, $\frac{1}{2}$ in. long, lower lobes almost subulate, ciliate, middle upper lobe longer than wide; corolla $\frac{1}{4}$ in. long, resin-dotted and stiff-pubescent. S. E. Eu.

5. *T. nummularius*, Bieb. (*T. Serpyllum* var. *nummularius*, Koch). Branches 4–5 in. high, stiff-pubescent: lvs. ovate to orbicular, with round or subcordate base, $\frac{1}{4}$ – $\frac{3}{4}$ in. long: fls. rose, in globose heads; calyx stiff-hairy, lower lobes lance-linear, stiff-ciliate, middle upper lobe slightly longer than wide; corolla $\frac{3}{4}$ in. long. S. W. Asia.

6. *T. nitidus*, Guss. Subshrub with ascending pubescent branches 2–3 in. long: lvs. ovate to oblong-ovate, $\frac{1}{2}$ in. long, obtuse, subglabrous, short-petioled, shining above, glandular-punctate and nerved beneath: fl.-whorls in a dense spike; calyx purplish toward apex, short-hairy, lower lobes strongly ciliate. Sicily.

7. *T. Herba-barona*, Loisel. Subshrub, procumbent, flowering branches retrorse-pubescent or becoming glabrescent, 2–4 in. long: lvs. rhomboid or ovate-lanceolate, $\frac{1}{8}$ – $\frac{1}{4}$ in. long, acute, resin-dotted, glabrous or ciliate at base: fls. rose to white, in globose heads; calyx white-hairy especially at throat, lobes ciliate, lower 3 lance-linear; corolla rose, $\frac{3}{4}$ in. long. Corsica, Sardinia.

8. *T. Marshallianus*, Willd. (*T. Serpyllum* var. *Marshallianus*, Boiss.). Suberect from somewhat woody procumbent base, branches 8–16 in. high, retrorse-pubescent in upper half: lvs. narrowly to broadly lanceolate, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, punctate on both sides, glabrous except for ciliate base: infl. subcapitate; calyx $\frac{1}{2}$ in. long, pilose, lower lobes linear-lanceolate, upper deltoid-lanceolate; corolla pale red, pilose, punctate, to $\frac{1}{4}$ in. long. (For F. A. Marschall von Bieberstein, page 40.) S. E. Eu.

9. *T. Serpyllum*, L. MOTHER-OF-THYME. Subshrubby, with creeping pubescent sts. rooting below, erect branches 2–3 in. high, retrorse-pubescent: lvs. elliptic to oblong, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, resin-dotted, glabrous except ciliate at least near base, very short-petioled, entire: infl. capitate; calyx $\frac{1}{2}$ in. long, tubular-campanulate, 10-nerved, pubescent at base, long-ciliate on the linear-lanceolate lower lobes, upper lobes as wide as long; corolla purplish, to $\frac{1}{4}$ in. long. (*Serpyllum*: Greek *creeping*, a pre-Linnæan name.) N. Eu.; nat. in N. Amer. Var. *albus*, Hort., fls. white. Var. *argenteus*, Hort., lvs. variegated with silver. Var. *aureus*, Hort., lvs. variegated with yellow. Var. *coccineus*, Hort., to 3 ft., fls. crimson. Var. *roseus*, Hort., fls. rose. Var. *splendens*, Hort., fls. brilliant red. Var. *vulgaris*, Benth. (*T. citriodorus*, Hort. not Schreber), lemon-scented.—Exceedingly variable and often made to include many of those here treated as species.

29. *CUNILA*, L. Known in cult. as a profusely blooming plant used for borders; of the 16 species constituting the genus, 2 are N. American, 2 Mexican, and the others S. American.—Low-growing tufted per. herbs or shrubs: lvs. usually small: fl.-whorls in loosely corymbed cymes or dense spikes or heads, axillary or terminal; fls. small; calyx 10–13-nerved, equally 5-toothed; corolla white or purplish, 2-lipped; perfect stamens 2. (Cuni-la: Latin name for a mint plant.)

C. origanoides, Britt. (*Satureja origanoides*, L. *C. mariana*, L.). MARYLAND DITTANY. STONE-MINT. Plant 1 ft. high: lvs. ovate, about 1 in. long, serrate, rounded or cordate at

base, nearly sessile, punctate: fls. purplish-pink, about $\frac{1}{4}$ in. long, in a loose cymose cluster terminating the st. or branchlets, blooming in early autumn; calyx densely bearded in the throat; corolla $\frac{3}{8}$ in. long. S. N. Y. to Ind. south to Fla.

30. **MENTHA**, L. MINT. Cult. more or less for the production of the aromatic essential oil present in all parts of the herb; sparingly used for ornamental purposes; species 25–30, all natives of the temp. zone, about half of them being native or nat. in N. Amer.—Erect branching herbs, often per. by leafy runners, stolons or underground rootstocks: lvs. opposite, sessile or petioled: fls. small, in axillary clusters or in terminal spikes or heads, the floral lvs. reduced to small bracts; calyx equally 5-toothed or somewhat bilabiate, the throat naked or hairy within; corolla-limb almost equally 4-lobed, or the upper lobe broader and entire or notched; stamens 4; ovary 4-parted: nutlets ovoid and smooth. (Men-tha: from the Greek name of a nymph, Minte.)

- A. Plant a miniature creeper. 1. *M. Requienii*
- AA. Plant larger, erect or ascending.
- B. Whorls of fls. all axillary.
 - c. Fls. nearly sessile; calyx villous in throat. 2. *M. Pulegium*
 - cc. Fls. distinctly pedicelled; calyx glabrous within. 3. *M. arvensis*
- BB. Whorls of fls. in terminal spikes or some in the upper axils.
 - c. Lvs. petioled; spikes thick.
 - d. Shape of lvs. lanceolate or ovate-lanceolate, acute. 4. *M. piperita*
 - dd. Shape of lvs. mostly ovate or elliptic, obtuse. 5. *M. citrata*
 - cc. Lvs. sessile or nearly so: spikes slender (except in *M. longifolia*).
 - d. Blades of lvs. crinkled and irregularly toothed or lacinate. 6. *M. aquatica* var. *trispica*
- DD. Blades of lvs. not crinkled, regularly serrate.
 - e. Species glabrous: lvs. lanceolate. 7. *M. spicata*
 - EE. Species pubescent or tomentose.
 - f. Ll.-blades elliptic or ovate-oblong, with rounded apex. 8. *M. rotundifolia*
 - ff. Ll.-blades lanceolate or oblong-lanceolate, acute to subacuminate. 9. *M. longifolia*

1. **M. Requienii**, Benth. Minute creeping herb with filiform minutely pubescent sts.: lvs. round, $\frac{1}{4}$ – $\frac{1}{2}$ in. across, petioled, slightly pubescent; fls. mauve or pale purple, in loose few-fl. whorls; calyx $\frac{1}{4}$ in. long; corolla slightly longer. (Named for E. Requien, page 50.) Corsica, Sardinia.

2. **M. Pulegium**, L. PENNYROYAL. Much-branched, sts. mostly ascending, 4–18 in. long; lvs. petioled, about $\frac{1}{2}$ in. or less long, round-oval, entire or slightly crenate, pubescent, in one var. sometimes variegated: fls. small, bluish-lilac, nearly sessile, in dense axillary whorls in late summer and early autumn; mouth of calyx closed by hairs; upper lobe of corolla notched. (Pulegium: an herbalist name, Latin *flea-bane*, supposed to drive away the fleas.) Eu., W. Asia.

3. **M. arvensis**, L. Per. by running rootstocks; sts. mostly ascending or prostrate, 8–24 in. long, variously pubescent: lvs. mostly short-petioled, ovate to broadly lanceolate, 1–2½ in. long, rather weakly toothed: cymes rather dense, axillary; calyx short-campanulate, to $\frac{1}{2}$ in. long, pubescent, resin-dotted; corolla mostly lilac, about $\frac{3}{4}$ in. long. Widely spread in the northern hemisphere. Var. *villosa*, S. R. Stewart (*M. canadensis*, L. *M. canadensis* var. *villosa*, Benth.), lvs. of infl. lanceolate and with cuneate base; N. Amer. Var. *piperascens*, Malinvaud, JAPANESE MINT, plant to 3 ft., lvs. larger; Japan; cult. for the menthol-containing oil.

4. **M. piperita**, L. PEPPERMINT. Per. by runners and rootstocks, with strong essential pungent or pepper-like oil (whence the name *piperita*); sts. erect or ascending, 1–3 ft. high, branched, glabrous: lvs. petioled, lanceolate or ovate-lanceolate, 1–3 in. long, sharply serrate, acute, glabrous or pubescent on veins beneath, punctate with minute oil-globules: fls. in thick terminal spikes 1–3 in. long, in fr. the central spike often finally exceeded by the lateral; calyx resinous-dotted, glabrous below, its sharp teeth usually ciliate; corolla purple, rarely white, about $\frac{1}{2}$ in. long, glabrous. Eu.

5. **M. citrata**, Ehrh. BERGAMOT MINT. Per. by leafy stolons, glabrous throughout or nearly so; sts. decumbent, 1–2 ft. long, branched: lvs. thin, petioled, broadly ovate or elliptic and obtuse or the uppermost lanceolate and acute, $\frac{1}{2}$ –2 in. long; fls. in the uppermost axils and in short dense terminal spikes; calyx glabrous, with subulate teeth; corolla glabrous, lavender, $\frac{1}{4}$ in. long. Eu.; nat. in Amer.

6. **M. aquatica**, L., var. *crispa*, Benth. (*M. crispa*, L.). Per. by stolons, much-branched; sts. weak, glabrous to somewhat puberulent, to 3 ft. long; lvs. ovate, $\frac{1}{2}$ –2 in. long, crisped, lacinate-serrate, obtuse to acute, short-petioled: fls. lilac, in terminal spikes to 1½ in. long; calyx puberulent, $\frac{1}{4}$ in. long; corolla $\frac{1}{2}$ in. long. Eu.; nat. in E. U. S.

7. **M. spicata**, L. (*M. viridis*, L.). SPEARMINT. Per. by leafy stolons, glabrous or nearly so; sts. erect, with ascending branches, 1–2 ft. high: lvs. sessile or nearly so, lanceolate or ovate-lanceolate, 2½ in. or less long, sharply serrate; whorls of fls. in narrow interrupted

spikes 2-4 in. long, the central spike exceeding the lateral ones, in summer and autumn; calyx-teeth hirsute or glabrate; corolla about $\frac{1}{2}$ in. long. Eu., Amer.; widely nat. about old gardens.

8. *M. rotundifolia*, Huds. (*M. spicata* var. *rotundifolia*, L.). APPLE OR ROUND-LEAVED MINT. Per. by leafy stolons, pubescent, somewhat viscid; sts. slender, erect or ascending, simple or branched, 20-30 in. high: lvs. sessile, elliptic or ovate-oblong, 1-4 in. long, subcordate at base, mostly obtuse, crenate-serrate, reticulated beneath: fls. in dense or interrupted spikes 2-4 in. long; calyx pubescent; corolla puberulent, white to reddish, $\frac{1}{4}$ to $\frac{1}{2}$ in. long. Eu.; nat. from Me. to New Mex. Var. *variegata*, Hort., lvs. variegated.

9. *M. longifolia*, Huds. (*M. spicata* var. *longifolia*, L. *M. silvestris*, L.). Stoloniferous; sts. erect, simple or branched, puberulent to tomentose, $1\frac{1}{2}$ -4 ft. high: lvs. nearly or quite sessile, lanceolate to lance-ovate, 2-5 in. long, sharply serrate, acute, pubescent to tomentose above, white-tomentose beneath: spikes thickish, dense or interrupted at base; calyx villous-tomentose; corolla purplish, pubescent, $\frac{1}{2}$ in. long. Eu., Asia.

31. *PERILLA*, L. Two or 3 herbs in the Himalayas to China and Japan, one sometimes grown for its colored foliage.—Lvs. opposite: fls. small, in axillary or terminal, simple or paniced racemes, each floral lf. subtending a single fl.; calyx campanulate, 5-toothed, in fr. bilabiate and much enlarged and swollen; corolla with short tube not exceeding calyx, the limb oblique and somewhat unequally 5-lobed; stamens 4, erect and distinct; disk represented by a large gland; style 2-parted. (Peril-la: said to be a native name in India.)

P. frutescens, Britt., var. *crispa*, Deane (var. *nankinensis*, Bailey). Slightly hairy or rarely glabrous ann.: lvs. long-petioled, broad-ovate, acute or short-acuminate, coarsely dentate, narrowed or rounded at base, $2\frac{1}{2}$ -4 $\frac{1}{2}$ in. long, dark purple-brown with a bronzy luster; floral lvs. ovate, shorter than calyx: fls. inconspicuous, borne in racemes and blooming in autumn, the calyx shaggy with long hairs, the white or reddish corolla about $\frac{1}{4}$ in. long. Himalayas, Burma, China, Japan.—Other vars. of the same species have lvs. wrinkled or crisped and fringed or cut, sometimes variegated.

32. *ELSHOLTZIA*, Willd. Twenty species in E. and Cent. Asia, south to Java, in Eu. and Abyssinia, a few grown in the fl.-garden.—Herbs or undershrubs, usually aromatic: lvs. short-petioled, serrate, often glandular-punctate: fls. small, often minute, in usually one-sided terminal spikes; calyx tubular or campanulate, 5-toothed; corolla 4-lobed, scarcely bilabiate, upper lobe emarginate and slightly concave, others flat and obtuse; stamens 4, the longer pair much-exserted, anther-cells diverging: nutlets ovoid or ovoid-oblong. (Elsholt-zia: John Sigismund Elsholtz, 1623-1688, German physician and botanist.)

E. Stauntonii, Benth. Undershrub reaching 5 ft., with terete pubescent branchlets: lvs. ovate-oblong to oblong-lanceolate, 3-5 in. long, acuminate, crenate-serrate, bright green and glabrous above, densely glandular-punctate below, floral lvs. minute and bractei-form: fls. lilac-purple, in dense one-sided spikes 4-8 in. long, usually paniced at the ends of the branches, Sept., Oct.; stamens and style long-exserted. (Named for G. L. Staunton, 1737-1801, born in Ireland, physician in London and the E. Indies, later an ambassador to China.) N. China.

33. *COLEUS*, Lour. Herbs or small shrubs, several forms widely cult. in window-gardens and greenhouses because of their variously colored and showy foliage; 90 or more species in the trop. and subtrop. parts of Asia, Afr., Australia and the Pacific isls.—Ann. or per., of upright growth: lvs. crenate, dentate or serrate, petioled or sessile: fls. small or medium-sized, mostly blue or lilac, in terminal spike-like racemes which are often branched; calyx 5-toothed, often deflexed in fr.; corolla with tube exserted and bilabiate limb, the lower lip longer than the upper and often inclosing the stamens and pistil; stamens 4, didynamous and declinate, filaments at base united into a short tube free from the corolla, anthers confluent: nutlets smooth. (Co-leus: Greek for *sheath*, referring to the monadelphous stamens.)

A. Peduncles short or nearly none; whorls close. 1. *C. Blumei*
AA. Peduncles slender, bearing 3 to several fls., making loose paniced whorls. 2. *C. thyrsoideus*

1. *C. Blumei*, Benth. Probably to be regarded as an assemblage of forms: soft per. herb or subshrub, little branched, 2-3 ft. high: lvs. ovate, narrowed or broad at base, sharply and nearly regularly toothed, in some forms laciniated, long-acuminate, variously colored with yellow, dull red and purplish: fls. dark blue or whitish. (Bears the name of K. L.

Blume, page 40.) Java. Var. *Verschaffeltii*, Lem., more robust and branchy; lvs. more brilliantly colored, acute, truncate or cordate at base, irregularly cut-dentate with rounded teeth giving the margin a crispy effect; the commoner form.

2. *C. thrysoideus*, Baker. Shrub 2-3 ft. high, with pubescent sts.: lvs. cordate, acuminate, coarsely crenate, the lower 7 in. long; fls. bright blue, in racemes which contain many forking cymes of 3-10 fls. each, corolla $\frac{3}{4}$ in. long. Cent. Afr.

34. **IBOZA**, N. E. Br. Represented in the trade by a single showy-fl. small shrub or tall herb blooming in winter; more than a dozen species in S. and trop. Afr.—Plant diœcious: bracts and fls. very small, the staminate fls. larger and bearing an abortive ovary or style; calyx minute, 3-lobed; corolla very small, with funnel-form tube and more or less unequally 4-5-lobed limb; stamens 4, free and separate; ovary 4-lobed: nutlets erect, oblong or ovoid, dorsally compressed. (Ibo-za: Kafir name.)

I. riparia, N. E. Br. (*Moschosma riparium*, Hochst.). Stout per. 2-5 ft. high, with branching and obtusely 4-angled st.: lvs. broadly ovate, 1-2 in. long, mostly notched at base and coarsely toothed: fls. creamy-white with dark anthers, very numerous, in erect panicles above the foliage; corolla $\frac{1}{2}$ in. or more long, two to three times longer than calyx, the tube exserted.

35. **OCIMUM**, L. Little known in cult. except the basil which is used in seasoning and also grown for its pleasing fragrance; species 50-60 in the warmer parts of the world.—Ann. or per. herbs or small shrubs of variable habit: fls. mostly small, the whorls usually 6-fl. and in terminal or paniculate racemes; calyx deflexed in fr., the teeth unequal, the margin of the broad upper teeth decurrent into the tube; corolla-tube usually not exceeding the calyx, 2-lipped, the upper lip 4-lobed; stamens 4, declined; style shortly 2-cleft: nutlets ovoid or subglobose, smooth or punctate. (O-cimum: an old Greek name.)

O. Basilicum, L. **BASIL**. Glabrous or slightly pubescent ann., much-branched, 1-2 ft. high, often with purplish foliage: lvs. petioled, ovate, 1-2 in. long, entire or toothed: fls. white or more or less tinged purple, in moderately dense racemes; calyx becoming $\frac{1}{4}$ in. long; corolla $\frac{1}{3}$ - $\frac{1}{2}$ in. long; stamens slightly exserted. (Basilicum: old name, Greek *kingly*, because of its healing properties.) Trop. Asia, Afr., and Pacific isls.—**O. minimum**, L., **BUSH BASIL**, is probably a small cult. form of the foregoing, with sts. to 1 ft. high and lvs. subentire and $\frac{1}{2}$ - $\frac{3}{4}$ in. long.

Fig. 177. **NOLANACEÆ**. *Nolana paradoxa*: a, flowering branch, $\times \frac{1}{2}$; b, flower, vertical section, $\times 1$; c, ovary, vertical section, $\times 5$; d, stamen, on section of corolla-tube, $\times 3$; e, pistil, $\times 5$; f, fruit, $\times 1$.

177. **NOLANACEÆ**. **NOLANA** FAMILY

Herbs or small shrubs of 2 genera and over 60 species native in Chile and Peru, many of them maritime.—Lvs. alternate or in pairs: fls. solitary, bisexual, regular; calyx 5-cleft; corolla gamopetalous, hypogynous, 5-lobed, plicate in the bud; stamens 5, unequal, alternating with lobes of corolla and inserted in the base of it; disk present, often lobed; ovary superior, usually of 5 carpels which are radially or transversely lobed and split into 3 to many distinct nutlets or foliicles which are 1-8-seeded.

NOLANA, L. About 57 species of prostrate herbs, suitable for planting in borders, rocky hillsides, and baskets.—Technical characters as for the family. (Nola-na: *nola*, a little bell, referring to the shape of the corolla.)

- A. Lvs. with distinct petioles and broad blades. 1. *N. paradoxa*
 AA. Lvs. strap-shaped, without distinct petioles. 2. *N. acuminata*

1. *N. paradoxa*, Lindl. (*N. atriplicifolia*, D. Don. *N. grandiflora*, Lehm.). Succulent per. with fleshy tap-root; sts. spotted and streaked with purple above, to 1 ft. or more long; lvs. 2-3 in. long, with distinct petioles which are abruptly expanded into broad blades; fls. blue with white throat which is yellow within, 1-2 in. across, on long slightly hairy peduncles; corolla-lobes angular, each with 3 straight branched ribs; stamens villous at base; ovaries numerous, 1-seeded, surrounded at base by an annular nectary.

2. *N. acuminata*, Miers (*Sorema acuminata*, Miers. *N. lanceolata*, Miers). Succulent hairy somewhat glandular ann., distinguished from *N. paradoxa* by the strap-shaped lvs. decurrent at base and without distinct petioles, and the smaller nutlets.

Fig. 178. SOLANACEÆ. A, *Nierembergia hippomanica* var. *violacea*: Aa, flowering branch, $\times \frac{1}{2}$; Ab, flower, $\times \frac{1}{2}$; Ac, same, perianth partly excised, $\times 2$; Ad, flower, face view, $\times \frac{1}{2}$. B, *Lycopersicon esculentum*: Ba, flowering branch, $\times \frac{1}{2}$; Bb, flower, $\times 1$; Bc, flower, vertical section, corolla partly excised, $\times 2$; Bd, ovary, cross-section, $\times 5$. C, *Schizanthus pinnatus*: Ca, flower, $\times 1$; Cb, same, perianth expanded, $\times 1$. D, *Brodiaea viscosa*: Da, flower, face view, $\times \frac{1}{2}$; Db, flower, perianth excised in vertical section, $\times 1$. E, *Nicotiana glauca* var. *grandiflora*: Ea, flower, vertical section, $\times \frac{1}{2}$; Eb, bud, partially expanded, $\times \frac{1}{2}$; Ec, capsule, $\times \frac{1}{2}$.

178. SOLANACEÆ. NIGHTSHADE FAMILY

A great family abounding in the tropics but well represented also in temp. regions, of 75 or more genera and more than 2,000 species, yielding many subjects for ornament as also for food and drugs.—Erect or climbing herbs, shrubs, or small trees, with mostly alternate entire or variously dissected or pinnate exstipulate lvs.: fls. mostly bisexual and regular, with valvate or plicate aestivation, 5-lobed, the gamopetalous corolla prevailingly rotate but varying greatly in its shape and structure, sometimes very irregular; calyx 5-lobed; stamens typically as many as lobes of corolla and alternate with them, often connivent by their anthers, sometimes 1 or more of them sterile; hypogynous disk usually present; family marked by superior

normally 2-celled ovary with axile placenta together with usually plicate or valvate corolla-lobes, ovules mostly many, style 1 and stigma simple or lobed: fr. a berry or caps.—The family has many poisonous members.

- A. Stamens all fertile and not didymous (twin), usually 5.
 B. Fr. a berry (sometimes very large) or at least not capsular and not dehiscent.
 C. Anthers connivent around the style.
 D. Two cells of anthers close together and parallel, not separated by a broadened filament or connective.
 E. Opening of anthers mostly by a pore or slit at or near the apex. 1. SOLANUM
 EE. Opening from base to top, the apex extended into an empty extremity. 2. LYCOPERSICON
 DD. Two cells separated by a prominently broadened or thickened filament or connective. 3. CYPHOMANDRA
 CC. Anthers not connivent around style, dehiscing longitudinally.
 D. Calyx enlarging in fr.
 E. Plants herbaceous: fls. rotate or at most funnelform.
 F. Fruiting calyx spreading, about as long as fr. 4. ATROPA
 FF. Fruiting calyx bladderly-inflated, permanently inclosing the berry.
 G. Ovary 2-celled: fruiting calyx 5-toothed. 5. PHYSALIS
 GG. Ovary 3-5-elled: fruiting calyx 5-parted. 6. NICANDRA
 EE. Plants woody: calyx appressing or inclosing the berry: fls. long-tubular, with narrow limb. 7. IOCHROMA
 DD. Calyx not so: mostly woody plants.
 E. Nodes bearing spines. 8. LYCIUM
 EE. Nodes not spiniferous.
 F. Fls. 2 in. or less long: not true climbers.
 G. Corolla rotate or bell-shaped.
 H. Foliage radical: root very large. 9. MANDRAGORA
 HH. Foliage cauline and root fibrous. 10. CAPSICUM
 GG. Corolla distinctly tubular or cylindrical or urn-shaped.
 H. Ovules (and seeds) 3-6 in each cell, some of them usually abortive in fr. 11. CESTRUM
 HH. Ovules many in each cell. 12. SALPICHROA
 FF. Fls. very large, corolla 4 in. or more long: tall climber. 13. SOLANRA
 BB. Fr. capsular, mostly dehiscent or at length splitting.
 C. Foliage heath-like. 14. FABIANA
 CC. Foliage wholly otherwise.
 D. Caps. opening by a lid (circumscissile). 15. HYOSCYAMUS
 DD. Caps. splitting lengthwise or bursting irregularly.
 E. Calyx nearly or quite covering the fr. 16. NICOTIANA
 EE. Calyx much shorter than fr., mostly reflexing. 17. DATURA
 AA. Stamens paired, one or more of them often smaller or abortive.
 B. Perfect stamens 2. 18. SCHIZANTHUS
 BB. Perfect stamens 4 or 5.
 C. Number of perfect stamens 5.
 D. And affixed at top of tube. 19. NIEREMBERGIA
 DD. And affixed at middle of tube or lower. 20. PETUNIA
 CC. Number of perfect stamens 4.
 D. Anthers with all cells developed.
 E. Fr. a dry caps.: herb viscid-pubescent. 21. SALPIGLOSSIS
 EE. Fr. fleshy, more or less berry-like: plant woody, not viscid. 22. BRUNFELSIA
 DD. Anthers with 1 cell in each of shorter pair not developed.
 E. Tube of corolla straight and cylindrical. 23. BROWALLIA
 EE. Tube twisted, broadened at throat. 24. STREPTOSOLEN

1. SOLANUM, L. NIGHTSHADE. One of the largest genera of plants, of which about 1,500 species are described, in temp. and trop. climates around the world, yielding a number to hort. and agriculture.—Herbs, shrubs, sometimes trees, many of them climbing, some species strongly spiny, often with stellate pubescence: lvs. alternate, simple or compound: infl. mostly super-axillary or opposite the lvs., the buds before anthesis commonly drooping: fls. gamosepalous and gamopetalous, corolla mostly rotate or shallowly bell-shaped and plaited in the bud, white, blue, purple, yellow, often showy; stamens typically 5, inserted on throat of corolla, the anthers connivent in a cone about the pistil and mostly opening at the apex; ovary prevailingly 2-celled, many-ovuled; stigma small: fr. a berry. (Solanum: said to be from Latin *solamen*, quieting, alluding to sedative qualities.)—Some of the coarse species are grown in the open for their bold foliage effect, others for their showy fls. and frs.; others for edible parts.

- A. Species not climbing.
 B. Kinds grown for subterranean tubers. 1. *S. tuberosum*
 BB. Kinds grown for the edible fr. or for ornament.
 C. Plant without spines.
 D. Fls. violet or purple, 1 in. or more across.
 E. Fr. 2-12 in. long, maturing singly. 10. *S. Melongena*
 EE. Fr. ½-1 in. long, in clusters. 2. *S. Rantonnettii*

- DD. Fls. white, $\frac{1}{2}$ in. or less across.
 E. Lvs. ovate: fr. black, in clusters. 3. *S. nigrum*
 EE. Lvs. oblong: fr. scarlet or yellow, often solitary.
 F. Twigs glabrous. 4. *S. Pseudo-Capsicum*
 FF. Twigs stellate-pubescent. 5. *S. Capsicastrum*
 CC. Plant spiny.
 D. Young parts and under surface of lvs. rusty-tomentose.
 E. Sts. strongly winged. 6. *S. robustum*
 EE. Sts. not winged. 7. *S. Warscewiczii*
 DD. Young parts and lvs. with gray or whitish pubescence.
 E. Fls. white. 8. *S. integrifolium*
 EE. Fls. blue or violet.
 F. Lvs. narrow, finely pubescent or silky. 9. *S. muricatum*
 FF. Lvs. broad-ovate or broader, mostly scurfy or coarsely pubescent. 10. *S. Melongena*
 AA. Species of climbing plants.
 B. With prickles on lvs. and sts. 11. *S. Wendlandii*
 BB. Without prickles.
 C. Sts. and lvs. glabrous.
 D. Lvs. 1-3 in. long, upper ones entire. 12. *S. jasminoides*
 DD. Lvs. 4 in. or more long, mostly pinnate or pinnatifid. 13. *S. Seaforthianum*
 CC. Sts. and lvs. usually pubescent. 14. *S. Dulcamara*

1. *S. tuberosum*, L. POTATO. Herbaceous from underground st.-tubers, the weak pubescent or glabrate sts. 1-3 ft. long: lvs. odd-pinnate, 4-10 in. long, with 3 or 4 pairs of ovate pointed entire lfts. with smaller ones between: fls. few in long-peduncled forking clusters, white to bluish, 1-1 $\frac{1}{4}$ in. across, the corolla rotate; calyx-lobes linear-lanceolate, about one-third length of corolla: fr. (infrequently produced) a 2-celled or 3-celled globular berry $\frac{3}{4}$ in. or less diam., yellowish or green. Temp. Andes.

2. *S. Rantonnettii*, Carr. Erect puberulent or glabrate shrub, 3-6 ft., with ridge-lines on the sts.: lvs. simple and entire but margins more or less undulate, ovate, lance-ovate to elliptic, 1-4 in. long, acute or obtuse, narrowed to slender petiole, mostly puberulent at least on veins: fls. few, slender-pedicelled, in axillary nearly or quite sessile clusters, about 1 in. across, potato-like, dark blue or violet and usually with a lighter center: berries drooping, $\frac{1}{2}$ -1 in. long, heart-formed, red. (Grown as a novelty the middle of last century in France by Mons. Rantonnet.) Paraguay, Argentina.

3. *S. nigrum*, L. A prostrate, ascending or erect glabrous or somewhat pubescent variable branchy weed of world-wide distribution, but certain forms cult. for the large edible berries and then known as Morelle, Garden Huckleberry, Wonderberry, Sunberry; the lvs. are eaten as greens in some countries: lvs. simple, usually ovate or lance-ovate, 2-5 in. long or often longer in the cult. plant, pointed, entire or variously angled, petioled: fls. $\frac{1}{4}$ in. or less across, white, in pendulous lateral little clusters: berries black, about $\frac{1}{4}$ in. diam. or perhaps twice as large in the cult. kinds: ann. or perhaps of longer duration in warm climates, 1-2 $\frac{1}{2}$ ft. high: perhaps more than one species is involved in the multitude of forms.—Unripe frs. and lvs. may be poisonous.

4. *S. Pseudo-Capsicum*, L. JERUSALEM-CHERRY. Widely distributed small branching erect shrub, 2-4 ft., glabrous: lvs. narrow-oblong to oblanceolate, 2-4 in. long, obtuse or only short-acute, narrowed to a short petiole, entire but more or less undulate, glabrous both sides, upper surface shining: fls. white, $\frac{1}{2}$ - $\frac{1}{2}$ in. across, solitary or few, lateral: fr. globular, size of cherry, scarlet or yellow, long-persistent and therefore giving the plant a highly ornamental character, poisonous when eaten. (*Pseudo-Capsicum: false capsicum*, an ante-Linnæan name for the plant.) Probably of Old World origin.

5. *S. Capsicastrum*, Link. FALSE JERUSALEM-CHERRY. Much like no. 4 but differing in the stellate pubescence or light tomentum on the young parts, pedicels, and under surfaces of lvs., giving the plant a grayish not shining appearance: lvs. often 2 together, one large and one small, the larger ones 2-3 in. long, sometimes variegated: fr. usually ovoid and somewhat pointed, scarlet or orange-red, relatively not long-persistent. (*Capsicastrum: capsicum-like*.) Brazil.

6. *S. robustum*, Wendl. (*S. alatum*, Seem. & J. Schmidt). Strong shrub, 3-5 ft. or more, with strongly winged sts. and strong spines, the growing parts and under surfaces of lvs. rusty-tomentose: lvs. simple, sinuately lobed or angled, ovate-elliptic in outline, 10-12 in. and more long, the ribs and long winged petiole spiny, puberulent above with forked and stellate hairs: fls. few to several in rather close rusty-tomentose lateral peduncled clusters, white, 1 in. or more across, corolla-lobes narrow and acute: fr. globose, about $\frac{1}{2}$ in. diam., with rusty tomentum. Brazil.

7. *S. Warscewiczii*, Weick. Strong shrub, 4-6 ft., much like *S. robustum* but without winged sts., and lvs. with several narrow lobes on either side sometimes extending half or more the width of the blade: corolla white, 1 $\frac{1}{2}$ in. across: fr. pale yellow, glabrous, shining. (Von Warscewicz, page 291.) Probably from S. Amer.

8. *S. integrifolium*, Poir. (*S. coccineum*, Hort.). SCARLET or TOMATO EGGPLANT. Ann. coarse herb, branched, 3 ft., the growing parts pubescent and scurfy, with strong hooked spines: lvs. ovate to oblong-ovate, simple, sinuate-lobed to one-third or less width of blade,

4-8 in. long, more or less spiny on ribs and petiole, becoming glabrate above, stellate-pubescent or tomentose beneath: fls. white, in short-peduncled clusters of 2-6, about $\frac{3}{4}$ in. across, calyx prickly: fr. globular but usually flattened on the ends, 1-2 in. across, the sides prominently furrowed, scarlet or yellow, smooth and bright. Probably African, but widely spread.—Sometimes grown for its ornamental frs. *S. texanum*, Hort., appears to be a spineless race of this species.

9. *S. muricatum*, Ait. PEPINO. Erect spiny per. herb or subshrub, 2-3 ft., finely pubescent to glabrate: lvs. simple, entire or margins undulate, oblong-lanceolate to lance-ovate, 3-6 in. long, tapering to obtuse or acutish apex, long-petioled: fls. in a long-peduncled cluster, about $\frac{1}{2}$ – $\frac{3}{4}$ in. across, bright blue, the corolla deeply 5-lobed and puberulent outside: fr. ovoid and usually with a point, 4-6 in. long and hanging on a long peduncle, yellow with splashes and streaks of violet-purple, flesh yellow and seedless in cult., acid, aromatic, long-keeping, edible, with a melon-like quality (plant sometimes called Melon Shrub). Probably Peru.—Now and then cult. in the U. S., largely as a curiosity.

10. *S. Melongena*, L. Erect and much-branched stout herb or subshrub, probably native in S. Asia, only the vars. much cult. in this country. (Melongena: a pre-Linnæan name, perhaps associated with the Greek word for apple.) Var. *esculentum*, Nees. COMMON EGGPLANT. Bushy erect per. grown commonly as an ann., 2-3 ft., gray-tomentose and more or less scurfy, sometimes with a few spines: lvs. simple, oblong, oval or ovate, 6-15 in. long, thick and heavy, unequal at base, acute or obtuse at apex, obscurely angled or lobed: fls. mostly solitary, opposite the lvs. or subopposite, inclined or nodding, $1\frac{3}{4}$ –2 in. across, violet, rotate, the calyx usually prickly: fr. a large pendent ovoid, oblong or obovoid berry, 2-12 in. long, shining, purple, white, yellowish, or striped. Var. *serpentinum*, Bailey. SNAKE EGGPLANT. Differs in its fr., which is a curiosity, to 12 in. long and only 1 in. or less thick, curled at the end. Var. *depressum*, Bailey. DWARF EGGPLANT. Small and straggling plant nearly or quite glabrous and the young parts usually purplish, mostly spineless: lvs. only 2-6 in. long, thin, scarcely lobed: fls. small and long-peduncled: fr. pyriform to obovoid, 4-5 in. long, purple.

11. *S. Wendlandii*, Hook. f. Very strong large glabrous shrubby climber: lvs. 6-10 in. long, pinnatifid with 2-3 pairs of rather small segms., the terminal part large and mostly 3-lobed, usually the midrib, petiole and young sts. prickly; some of the upper lvs. simple and oval to oblong-acuminate: fls. lilac-blue, 2-2 $\frac{1}{2}$ in. across, in large forking clusters: fr. globose. (Received at Kew from Dr. Wendland of the Botanic Garden in Hanover.) Costa Rica.—A showy arbor and porch climber in S. Fla., S. Calif., and S.

12. *S. jasminoides*, Paxt. Climbing slender-stemmed glabrous spineless shrub grown under glass and in the open in mild climates, 10 ft. and more: lvs. 1-3 in. long, the upper ones simple and entire, lance-ovate to lanceolate, long-pointed, many of the lower ones irregularly pinnatifid or pinnate with small side or basal segm.: fls. slender-pedicelled, in forking terminal and lateral clusters, about 1 in. across, white tinged blue, the corolla star-shaped and attractive. Brazil.

13. *S. Seaforthianum*, Andr. Slender climbing glabrous spineless shrub, 10 ft. and more: lvs. 4-8 in. long, all essentially odd-pinnate or those on flowering twigs sometimes simple, petiolate; pinnæ (or segms.) 2-4 pairs and often smaller ones between, narrow-ovate to lanceolate, acuminate, narrowed to base and often petiolulate, margins entire, often undulate: fls. many in small cymes, divaricately arranged on the sides of a rachis, 1 in. or less across, star-shaped, blue or purple: fr. ovoid to globose, scarlet, $\frac{1}{2}$ in. across. (Intro. into England from the W. Indies in 1804 by Lord Seaforth.) Probably Brazil.

14. *S. Dulcamara*, L. EUROPEAN BITTER-SWEET. Shrubby climber to 8 ft., usually pubescent but becoming glabrate: lvs. ovate, 2-4 in. long, entire or 3-lobed at base: fls. in long-stalked cymes, violet spotted with green, rotate, $\frac{1}{2}$ in. across, corolla-lobes acuminate and reflexed: fr. ovoid, scarlet, $\frac{1}{2}$ in. long, poisonous when eaten in quantity. (Dulcamara: Latin bitter-sweet.) Eu., Asia; nat. in N. Amer.

2. LYCOPERSICON, Mill. TOMATO. About a half dozen S. American soft herbs, per. and perhaps ann., two of them grown for the edible fr.; sometimes united with Solanum but differing in being always unarmed, lvs. always pinnate or pinnatifid, and particularly in the anthers which are projected into sharp or narrow sterile tips and which dehisce from top to bottom: fls. yellow: fr. a pulpy berry; cells 2 or few, multiplying under domestication. (Lycopersicon: Greek *wolf peach*, probably in reference to supposed poisonous qualities.)

A. Plant hairy, with strong odor.....1. *L. esculentum*
AA. Plant not hairy, very slender, with little or indifferent odor.....2. *L. pimpinellifolium*

1. *L. esculentum*, Mill. (*Solanum Lycopersicum*, L. *Lycopersicon Lycopersicon*, Karst.). Spreading hairy-pubescent and more or less glandular strong-smelling plur-ann. or per., 3-6 ft. or more, the young growth on mature plants erect: lvs. odd-pinnate with small lfts. interposed, 6-18 in. long; main lfts. 5-9, stalked, ovate to oblong, 2-3 in. long,

acuminate, irregularly toothed, margins tending to roll inward: fls. 3-7, nodding, $\frac{3}{4}$ in. or more across, on jointed pedicels: fr. red or yellow, usually flattened at the ends, 2-3 in. across, the sides furrowed or angled. W. S. Amer. Var. *cerasiforme*, Alef. (*L. cerasiforme*, Dunal). CHERRY TOMATO. Lvs. thinner and mostly smaller and usually less acuminate: fls. prevailing in longer clusters: fr. globular and regular, about $\frac{3}{4}$ in. diam., red or yellow, few-celled; forms with oblong fr. are the Plum tomatoes. Var. *pyriforme*, Alef. (*L. pyriforme*, Dunal). PEAR TOMATO. Differs in bearing pear-shaped frs., which are usually about $1\frac{1}{2}$ in. long. Var. *commune*, Bailey (var. *vulgare*, Bailey not Alef.). COMMON TOMATO. Lfts. little if at all conduplicate or curled, the plants heavier and more lopping: fr. mostly globular or only moderately oblate, 3 in. and more across, not furrowed or lobed on the sides; parts of the fl. often multiplied, the cells becoming many. Cultigen. Var. *grandifolium*, Bailey. LARGE-LEAVED or POTATO-LEAVED TOMATO. Lvs. large and plane; lfts. usually not more than 5, large, with entire margins, the secondary lfts. few or none. Cultigen. Var. *validum*, Bailey. UPRIGHT TOMATO. Plant stout and erect, very compact, the lvs. crowded and curled. Cultigen; little grown in this country.—The tomato species is yet under taxonomic study.

2. *L. pimpinellifolium*, Mill. (*Solanum pimpinellifolium*, Jusl. *L. racemiforme* and *L. racemigerum*, Lange). CURRANT TOMATO. Weak, slender-stemmed, not hairy but finely puberulent, the odor not pronounced: lfts. 5-7 with smaller ones interposed, long-stalked, ovate, $\frac{3}{4}$ - $1\frac{1}{2}$ in. long, pointed or obtuse, base sometimes cordate: fls. 10-25 in an elongating 2-sided raceme, the pedicels prominently geniculate: fr. red, currant-like, about $\frac{1}{2}$ in. diam., 2-celled. Peru.

3. *CYPHOMANDRA*, Sendt. Thirty or more S. American herbs, shrubs, and small trees, technically separated from Solanum in the fact that the 2 anther-cells are separated by a thickened connective which appears as a column on the back of the anther: erect spineless plants, with large, entire, 3-lobed or pinnatisect lvs.: fls. pedicellate in racemes or scorpioid cymes, calyx and rotate or bell-shaped corolla 5-lobed; anthers opening at apex or on side: fr. a 2-celled many-seeded berry, sometimes large, in one species prized as a cult. esculent. (Cyphoman-dra: Greek, referring to the peculiar anthers.)

C. betacea, Sendt. (*Solanum betaceum*, Cav.). TREE-TOMATO. Tree-like somewhat woody shrub 6-10 ft., mostly pubescent or puberulent: lvs. simple and entire, cordate-ovate, 8-12 in. long, short-pointed, prominently pinnate-veined, soft-pubescent: fls. about $\frac{1}{2}$ in. across, pinkish, fragrant, the corolla-lobes long and narrow: fr. egg-shaped, 2-3 in. long, smooth, long-peduncled, dull red, with a slightly acid tomato-like flavor. S. Amer.—Grown in the open in subtrop. parts and sometimes under glass in the N.

4. *ATROPA*, L. Two to 4 species of Old World herbs, one of economic importance as a source of atropine and other powerful drugs.—Erect: lvs. entire: calyx bell-shaped, with 5 ovate leafy divisions, enlarging in fr.; corolla bell-shaped or funnel-form: fr. a berry, subtended by enlarged calyx-lobes, poisonous. (At-ropa: after Atropos, the Fate who severs the thread of life.)

A. Belladonna, L. BELLADONNA. Branching leafy per., 2-3 ft., sparsely pubescent to glabrate: lvs. entire, ovate or oblong-ovate, 3-6 in. long, acuminate, narrowed to a petiole: fls. solitary or in pairs, nodding, on axillary pedicels; corolla blue-purple or dull red, about 1 in. long: berry nearly globular, slightly 2-lobed, about $\frac{1}{2}$ in. across, seedful, shining black. (Belladonna: Italian *beautiful woman*, the red sap used as a cosmetic in Italy.) Eu. and Asia.

5. *PHYSALIS*, L. HUSK-TOMATO. GROUND-CHERRY. Low herbs of warm and temp. countries, largely America, a few grown for the edible frs. and also for the ornamental fruiting calyx of some species; probably 100 or more species.—Ann. and per. summer-flowering herbs or sometimes slightly woody at base, straggling, diffuse or creeping, glabrous or pubescent: lvs. alternate, often 2 together, simple, mostly angled and distinctly petioled, commonly soft in texture: fls. usually on axillary or extra-axillary pedicels, mostly blue or yellowish or whitish and not showy; calyx 5-toothed, becoming large and bladder-like and inclosing the 2-celled globular yellow or greenish often more or less viscid berry; corolla rotate or short-campanulate, usually with purplish spots in the center, plicate, short-tubed and mostly 5-toothed; stamens 5; style slender, the stigma somewhat 2-lobed. (Phys-alis: Greek *bladder*, referring to the fruiting calyx.)—Species of Physalis are yet confused and in need of further study.

- A. Plants with large red calyces in fr. 1. *P. Alkekengi*
 AA. Plants with green or yellow or at most only red-veined calyces: mostly grown for the edible berry.
 B. Sts. glabrous or very nearly so 2. *P. ixocarpa*
 BB. Sts. pubescent or hairy.
 C. Base of lf. conspicuously uneven or oblique 3. *P. pruinosa*
 CC. Base of lf. usually evenly cordate or truncate 4. *P. peruviana*

1. *P. Alkekengi*, L. (*P. Franchetii*, Hort. *P. Alkekengi* var. *Franchetii*, Makino. *P. Bunyardii*, Hort.). ALKEKENG. WINTER-CHERRY. CHINESE LANTERN-PLANT. Diffuse per. but sometimes grown as an ann. with long creeping underground sts., 1–2 ft. high, usually with zigzag mostly simple angled pubescent or glabrous sts.; lvs. ovate with broad base, 2–3 in. long, short-acuminate, often angular, ciliate, the petiole widening at top; fls. $\frac{3}{4}$ in. across, whitish, the anthers yellow; fr. red, the large ripened calyx blood-red, about 2 in. long, and very showy. (Alkekengi: Arabian name.) Apparently native from S. E. Eu. to Japan, but now adventive or nat. in many parts of the world.—An old garden plant, grown for its highly colored bladders.

2. *P. ixocarpa*, Brot. (*P. edulis*, Hort.). TOMATILLO. Erect branching ann. 3–4 ft. high, glabrous or very nearly so; lvs. thin, ovate to lance-ovate, 2–3 in. long, variously toothed or notched, long-petioled; fls. large and open, $\frac{3}{4}$ in. or more across, the border bright yellow and throat bearing 5 black-brown spots; anthers purplish; husk or enlarged calyx purple-veined, entirely filled by the large round purplish sticky berry, and sometimes torn by it. Mex., intro. northward.—Sometimes cult. for the fr.

3. *P. pruinosa*, L. STRAWBERRY-TOMATO. DWARF CAPE-GOOSEBERRY. Low gray-pubescent ann., with stout sts. more or less erect but becoming diffuse; lvs. ovate, 2–4 in. long, mostly acuminate, very oblique or semi-cordate at base, obtusely dentate or angled to the base; fls. $\frac{3}{4}$ in. or less long, bell-shaped, the limb or border erect and whitish-yellow, the throat marked with 5 brown spots inside; anthers yellow or tinged purple; calyx much shorter than corolla but enlarging in fr. and inclosing the globular yellow berry which is $\frac{3}{4}$ in. diam., sweetish and not glutinous. Mass. to Fla and Ala.—Frs. eaten raw or cooked, or used for preserves or pickles. Often confused with *P. pubescens*, L., which is more slender, less pubescent, lvs. often entire and not toothed to base; Pa. to Calif. and tropics.

4. *P. peruviana*, L. (*P. edulis*, Sims). CAPE-GOOSEBERRY. Stronger grower than *P. pruinosa*, attaining a height of $1\frac{1}{2}$ –3 ft., maturing later; lvs. thicker, soft-pubescent, broad, often not toothed, evenly cordate or truncate at base; fls. $\frac{1}{2}$ – $\frac{5}{8}$ in. long, open-campanulate, the limb or border widely spreading and light yellow, the inside of the throat purple-blotched and veined; anthers blue-purple; husk thicker and larger, somewhat hairy, and longer-pointed; berry yellow, not glutinous, much like that of *P. pruinosa* but usually less sweet. Tropics.

6. *NICANDRA*, Adans. Ann. herbs from Peru, one an old-fashioned fl.-garden plant.—Differs from *Physalis* in the 3–5-celled ovary and the fruiting calyx deeply 5-parted. (Nican-dra: named for Nicander, poet of Colophon, who wrote on plants about 100 B. C.)

N. *Physalodes*, Gaertn. (*Atropa Physalodes*, L. *Physalodes peruvianum*, Kuntze. *P. Physalodes*, Britt.). APPLE-OF-PERU. SHOO-FLY PLANT. To 4 ft., much-branched; lvs. ovate to oblong, 2–6 in. long, narrowed at base, sinuate-toothed; fls. blue, $1\frac{1}{2}$ in. long and broad, solitary and nodding in axils on slender pedicels; limb of corolla nearly entire; berry inclosed in the enlarged green calyx $1\frac{1}{2}$ in. long, the lobes auricled at base. Escaped in E. N. Amer. and tropics.

7. *IOCHROMA*, Benth. Shrubs and small trees, sometimes grown under glass and in the open in subtrop. parts; species about 20, mostly in W. trop. S. Amer.—Spineless, glabrous or stellate-tomentose; lvs. entire, often large; fls. purple, blue, scarlet, yellow or white, in pairs, or sometimes clustered; calyx tubular or campanulate, 5-toothed, enlarging in fr. and appressing or inclosing the berry; corolla long-tubular or narrow-trumpet-shaped, with 5 short or very small lobes, the throat more or less closed by appendages or folds; stamens inserted below the middle of the corolla-tube; disk present or absent; ovary 2-celled; fr. a pulpy globose or ovoid berry. (Iochroma: Greek violet-colored.)

- A. Fls. blue; lvs. acute, long-petioled 1. *I. lanceolatum*
 AA. Fls. orange-scarlet (varying to white); lvs. very obtuse, short-petioled 2. *I. fuchsoides*

1. *I. lanceolatum*, Miers. Shrub 4–8 ft. high, more or less downy; lvs. alternate, ovate or elliptic-lanceolate, acute, entire, tapering to a long petiole; umbels supra-axillary and terminal; fls. rich deep purple-blue; calyx abrupt at base, shallowly blunt-toothed, puberulent or glabrate; corolla pubescent, the tube slightly curved, the margin shortly and unequally 5-lobed or -toothed. Ecuador.—*I. tubulosum*, Benth., is to be looked for; it is a

shrub 6-8 ft., with ovate ciliate lvs. and deep blue fls. on hairy pedicels; calyx subinflated, hairy, tapering, sharp-toothed; Colombia.

2. *I. fuchsoides*, Miers. Shrub, glabrous or nearly so: lvs. often clustered, obovate to oval or oblong, very obtuse, tapering to a short petiole: fls. more or less clustered, orange-scarlet (a white-flid. form is also offered), drooping; calyx broad or abrupt at base, shallowly blunt-toothed, puberulent; corolla thrice exceeding the 5-toothed bursting calyx, the tube long-cylindric and nearly straight, the limb 5-angled and with intermediate teeth. Peru.

8. **LYCIUM**, L. BOX-THORN. MATRIMONY-VINE. Woody plants, often climbing, grown for their fls. and attractive frs.; about 100 species in temp. and subtemp. parts of both hemispheres, often in dry regions.—Deciduous or evergreen shrubs, thorny or unarmed: lvs. alternate, often fascicled, short-petioled, small and commonly narrow, usually grayish-green, entire, without stipules: fls. greenish, whitish, purplish, or violet, axillary, solitary or clustered, not large but often numerous on the long branches; calyx campanulate, 3-5-toothed, not enlarging in fr.; corolla funnellform, with usually 5-lobed limb; stamens mostly 5, often with a bearded ring near the base of the filament: fr. a berry with few to many seeds, usually scarlet. (Lycium: Greek name from the country Lycia given to a Rhamnus, transferred later to this genus.)

A. Corolla-tube longer than limb, much narrower below the middle: lvs. lanceolate.

B. Base of filaments pubescent.....1. *L. halimifolium*

BB. Base of filaments glabrous.....2. *L. barbarum*

AA. Corolla-tube shorter than limb, rather wide: lvs. rhombic-ovate to ovate-lanceolate.....3. *L. chinense*

1. *L. halimifolium*, Mill. Upright or spreading shrub with arching or recurving branches, usually spiny, to 10 ft.; branchlets light gray, angled; lvs. oblong-lanceolate to lanceolate or oblanceolate, rarely elliptic-lanceolate, 1-2½ in. long, acute or obtusish, gradually narrowed at base into a slender petiole to ¾ in. long, grayish-green, thickish: fls. 1-4, on slender pedicels ¼-¾ in. long; calyx usually 1-3-lobed, divided about one-half, with obtusish lobes; corolla dull lilac-purple, the tube longer than the lobes and much narrowed below the middle; stamens hairy at base: fr. subglobose to ovoid or short-oblong, ½-¾ in. long, scarlet to orange-red. S. E. Eu. and W. Asia.

2. *L. barbarum*, L. Distinguished from *L. halimifolium* by the smaller narrower lvs. and glabrous filaments: branchlets canescent, spines to ½ in. long; lvs. linear to linear-oblong, to 1 in. long; corolla pale rose often fading to whitish. N. Afr. to Iraq.—Not hardy N. and grown mostly in S. W. U. S. The *L. barbarum* of most European authors is *L. halimifolium*.

3. *L. chinense*, Mill. Rambling shrub with arching and often prostrate branches, usually unarmed, to 12 ft. long: branchlets light yellowish-gray, angled: lvs. rhombic-ovate or ovate to ovate-lanceolate, 1½-3½ in. long, acute or obtusish, broad-to narrow-cuneate at base, bright green and remaining green until late in autumn; petiole usually not exceeding ½ in.: fls. 1-4, on pedicels ⅛-½ in. rarely to ½ in. long; calyx 3-5-toothed, usually divided less than one-half, with acute lobes; corolla purple, the lobes slightly longer than the rather wide tube; stamens hairy at base: fr. ovoid to oblong, ⅔-1 in. long, scarlet to orange-red. E. Asia.

9. **MANDRAGORA**, L. MANDRAKE. Three or 4 species of practically stemless per. herbs with thick or tuberous roots and undivided lvs., native in the Medit. country and the Himalayan region, interesting for medicinal qualities and also for connection with old superstitions; these are the true mandrakes, but in N. Amer. the name is applied to the may-apple (*Podophyllum peltatum*).—Lvs. all basal or semi-basal, broad, undulate: fls. rather large, solitary or fascicled among the foliage, whitish, blue-violet or purple, the 5-parted calyx somewhat enlarging in fr.; corolla bell-shaped, 5-lobed, bearing the 5 stamens on the tube below the middle; ovary 2-celled, with long style and expanded stigma: fr. a fleshy many-seeded globose berry. (Mandragora: ancient name of doubtful application.)—Seldom cult. Plants yield powerful extracts; the thick root sometimes has a human-like form of branching, and was formerly ascribed magical values.

M. officinarum, L. A ft. or so high, with spindle-shaped often branching root: lvs. ovate, to 1 ft. long, obtusish, undulate: fls. greenish-yellow, the corolla to 1 in. long, usually scarcely longer than the calyx. Medit. region and E.—*M. autumnalis*, Spreng., has violet fls., the corolla exceeding the calyx; Medit. countries.

10. CAPSICUM, L. RED PEPPER. Per. woody plants but known in northern vegetable-gardens as herbaceous annuals, probably native in Cent. and S. Amer., and 1 anomalous species in Japan; American species 1 or many, depending on the definition.—Erect much-branching essentially glabrous plants: lvs. ovate, elliptic to narrow-lanceolate, simple and entire: fls. white or greenish-white sometimes tinged violet, pedicelled, solitary or in 2's or 3's, erect or declined; calyx short, nearly truncate but usually with very short points, somewhat enlarging about the base of the fr.; corolla rotate or nearly so, usually 5-lobed; stamens commonly 5, not closely connivent, mostly bluish, anthers opening longitudinally; ovary 2-3-celled, but the cells often multiplying under domestication, style simple, stigma capitate: fr. a pod-like indehiscent many-seeded berry with thick integument, widely various in size, shape and color, pungent to the taste. (Cap-sicum: name not satisfactorily explained.)

C. frutescens, L. (*C. annum* and *C. baccatum*, L.). Shrub to 6-8 ft., trunk becoming 3 in. through, the wood very hard, but plants capable of fruiting the first year from seed and, in the N., not developing woody tissue before frost: lvs. various, often less than 1 in. long, in cult. forms sometimes 5 in. long, narrowed to petiole, usually acuminate: fls. $\frac{3}{8}$ – $\frac{5}{8}$ in. across, in developed and monstrous forms sometimes larger: fr. various in the wild or spontaneous shrubby trop. forms, strangely diverse in the cult. kinds, sometimes remaining erect, sometimes declined or drooping.—The capsicums may be variously and almost endlessly ranged into vars. The most practical classification is on the frs., as to position, size and shape. The biological type of *C. frutescens* may well be considered to be the little **BIRD PEPPER**, with undeveloped frs. (*C. microcarpum*, DC.): twiggy shrub with short internodes: lvs. ovate, 1-2 in. long: fr. erect, spherical or oblong, $\frac{3}{4}$ in. or less long and $\frac{1}{4}$ in. or less broad, mostly red: a prevailing wild or spontaneous form in warm countries. The races with developed frs. may be conveniently ranged in about four main groups: Var. **cerasiforme**, Bailey, **CHERRY PEPPER**, lvs. of intermediate size, ovate or oblong, 2-3 in. long; fr. erect or declined, spherical, subcordate or oblate, $\frac{1}{2}$ –1 in. diam., red, yellow, or purplish, very pungent. Var. **conoides**, Bailey, **CONE PEPPER**, like the last, but frs. conical or oblong-cylindrical, 1-2 in. long, usually erect. Var. **fasciculatum**, Bailey, **RED CLUSTER PEPPER**, plant compact, with narrow clustered lvs.; fr. erect, fascicled, very slender, 3 in. long and $\frac{1}{4}$ in. thick, red, very pungent. Var. **longum**, Bailey, **LONG PEPPER**, lvs. medium to large; fr. mostly drooping, elongated, 3-12 in. long and mostly tapering to apex, often curved, sometimes 2 in. thick at base; includes Long Red, Long Yellow, Chilli, Cayenne, and others. Var. **grossum**, Bailey, **BELL or SWEET PEPPER**, plant stout and tall; lvs. oblong-ovate, 4-5 in. long, fls. 1 in. or more across; fr. large and puffy with depression at base, the sides usually furrowed, either oblong, bell-shaped or apple-shaped and tomato-like, red or yellow, mild in flavor.

11. CESTRUM, L. Shrubs and small trees of the American tropics, planted in warm countries and grown under glass for the attractive and often very fragrant fls.; species about 150.—Lvs. simple and entire, mostly narrow rather than broad: fls. in axillary or terminal clusters, tubular, not large but numerous or bright-colored, greenish, white, yellow, or red, the limb salver-like or trumpet-like, the long tube either enlarged or contracted at the throat, the 5-toothed calyx relatively short; stamens attached in the tube, included; ovary 2-celled, with 3-6 ovules in each cell, usually on a short stipe; style slender, stigma expanded and sometimes 2-lobed: fr. a small berry, often scarcely succulent. (Ces-trum: old Greek name of some plant.)

- A. Fls. conspicuously contracted at mouth; corolla red or rose. (HABROTHAMNUS.)
- B. Infl. rather loose or elongated: corolla glabrous. 1. *C. purpureum*
- BB. Infl. globular-compact, commonly closely subtended by lvs.: corolla pubescent outside. 2. *C. fasciculatum*
- AA. Fls. not contracted at throat, but usually expanded; corolla white or yellow. (CESTRUM proper, sometimes known as Jessamines.)
- B. Lobes of corolla becoming distinctly reflexed. 3. *C. aurantiacum*
- c. Corolla orange-yellow. 4. *C. diurnum*
- cc. Corolla white. 5. *C. nocturnum*
- BB. Lobes erect or spreading. 6. *C. Parqui*
- c. Lvs. oblong-ovate or elliptic, short-acuminate. 7. *C. purpureum*
- cc. Lvs. on the lanceolate order, very long-tapering. 8. *C. elegans*

1. **C. purpureum**, Standl. (*Habrothamnus purpureus*, Lindl. *H. elegans*, Brongn. *C. elegans*, Schlecht.). Slender bush to 10 ft. or more, with flexuose hairy-pubescent branches with a somewhat scandent habit: lvs. narrow-ovate to ovate-lanceolate, $2\frac{1}{2}$ –5 in. long and 1– $1\frac{1}{2}$ in. broad, gradually acuminate, short-petioled, pubescent beneath and light-pubescent to glabrate above: fls. in rather loose terminal clusters that are more or less

nodding; corolla $\frac{3}{4}$ –1 in. long, red-purple, glabrous, upwardly swollen but constricted at the throat, very slender at the base, several times longer than the calyx, the acute lobes becoming reflexed; berries globular, about $\frac{1}{2}$ in. across, red. Mex. Var. *Smithii*, Bailey (*C. Smithii*, Hort.), has blush-rose fls.—An old greenhouse plant, of continuous bloom.

2. *C. fasciculatum*, Miers (*Meyenia fasciculata*, Schlecht.). Fls. purplish-red, larger than those of no. 1, mostly in spring, in compact globular clusters that are usually attended by small lvs. like an involucre; corolla pubescent outside: lvs. ovate, 2–2½ in. broad. Mex. Var. *Newellii*, Bailey (*C. Newellii*, Nichols.), has large bright crimson fls., and is a free bloomer.

3. *C. aurantiacum*, Lindl. Half-climbing nearly or quite glabrous shrub: lvs. ovate or oval, 3–4 in. long and 1¾–2½ n. broad, short-pointed and not very acute, often somewhat undulate: fls. 2–5 together, sessile, combined in a terminal panicle; corolla orange-yellow, ¾–1 in. long, the large acutish lobes strongly reflexed. Guatemala.

4. *C. diurnum*, L. DAY JESSAMINE. Large shrub to 15 ft., with wiry and puberulent growth: lvs. thick, persistent, oblong or elliptic, 2–3½ in. long, about 1 in. broad, obtuse or only indifferently acute, glabrous and glossy above, lighter colored and puberulent on veins beneath or becoming glabrate: fls. white, sweet-scented by day, sessile in short clusters on long axillary peduncles; corolla ½–½ in. long, the short bluntish lobes reflexed at full anthesis. W. Indies.

5. *C. nocturnum*, L. NIGHT JESSAMINE. Shrub to 12 ft., with glabrous angled branchlets: lvs. thin, mostly oblong-ovate to elliptic and rather short-acuminate, 4–8 in. long, mostly about 1½ in. broad, glabrous and more or less shining both sides, usually broad-based, petiole distinct: fls. greenish-white to cream-colored, very fragrant at night, nearly or quite sessile on axillary elongating but not long-peduncled clusters; corolla very slender, about ¾ in. long, the acute lobes erect or only spreading. W. Indies.

6. *C. Parqui*, L'Her. WILLOW-LEAVED JESSAMINE. Nearly glabrous shrub to 6 ft., distinguished by short-petioled narrow lvs. that are lanceolate and long-tapering at apex and base, 3–6 in. long, usually not much exceeding 1 in. broad: fls. greenish-white to greenish-yellow, fragrant at night, sessile in profuse axillary and terminal clusters; corolla ¾–1 in. long, the acute lobes wide-spreading and the edges sometimes revolute. (*Parqui* is the name of the plant in Chile, once proposed as a generic name.) Chile.—In certain broad-ld. forms difficult to separate from *C. nocturnum*.

12. *SALPICHROA*, Miers. About a dozen shrubs, subshrubs, or herbs of extra-trop. S. Amer. and 1 in Ariz., one sometimes used for cover-planting in S. Calif.—Lvs. entire, often hairy, narrowing to a long petiole: fls. white or yellow, solitary; calyx tubular, 5-cleft, in fr. hardly enlarged; corolla tubular or urn-shaped, with or without a woolly ring inside; stamens inserted at about the middle of the corolla-tube or even higher: berry ovoid or oblong, 2-celled, with numerous compressed seeds. (*Salpichroa*: Greek *tube* or *trumpet*, and *skin* or *complexion*, in reference to the form and texture of the fl.)

S. rhomboidea, Miers (*Atropa rhomboidea*, Gill.). COCKS-EGGS. A weedy climber, per. from a fleshy root, somewhat woody, with green flexuous branches and strong odor: lvs. subopposite, ovate-rhomboid, ½–¾ in. long, narrowed to a petiole: fls. white, solitary or rarely in pairs, nodding, on filiform pedicels scarcely shorter than the petioles; corolla short, urceolate, constricted below the middle and at the throat, about ½ in. long, the inside of the tube with a woolly ring; berry ovate-oblong, yellow or white, many-seeded, said to be edible but of poor flavor. Argentina.—Thrives in dry and alkaline places; mentioned as a forage plant for bees.

13. *SOLANDRA*, Sw. CHALICE-VINE. About a half dozen tall glabrous woody plants with branches climbing, bearing very showy fls., suitable for the warmhouse and grown in the open in the warmest parts of the U. S.—Lvs. entire, leathery, shining: fls. solitary, very large, white or yellow; calyx long-tubular, sleeve-like, 2–3-toothed at the apex; corolla funnelform, with long cylindric tube and oblique broad-campanulate throat, the limb with broad lobes; stamens 5, inserted near the base of the corolla; ovary 2-celled, with many ovules: berry globose or elongated, pulpy, more or less included in the calyx, with large smooth seeds. (*Solan-dra*: named for Daniel C. Solander, 1736–1786, Swedish naturalist and traveller.)

S. guttata, Don (*Swartzia guttata*, Standl.). Strong branching climbing shrub: lvs. elliptic-oblong, acute or very short-acuminate or sometimes blunt at apex, 2–6 in. long: fls. terminal, solitary, fragrant; calyx tubular, about 3 in. long, with 3-lobed limb; corolla ochre-yellow, funnelform, 9 in. long, the slender part much exceeding calyx, the limb with

5 crenate and undulate lobes, the throat with 5 purple-brown ridges; stamens subequal, scarcely protruding beyond the throat; pistil prominent. Mex.—Sometimes grown as *S. grandiflora*, Sw., in which, however, the slender part of the tube is not longer than calyx.

14. **FABIANA**, Ruiz & Pav. A score or so of small heath-like shrubs, one sometimes grown for ornament in cool greenhouses and in mild climates; Bolivia and Brazil to Patagonia.—Erect branching plants, sometimes viscid: lvs. small and crowded: fls. small, white, usually many, terminal or opposite the lvs.; calyx tubular-campanulate, shortly 5-toothed; corolla-tube elongate, dilated or ventricose above, the short limb 5-lobed or scarcely lobed; stamens 5, unequal, inserted at or below the middle of the corolla-tube, included; disk fleshy, annular or lobed; ovary 2-celled: caps. oblong, 2-valved. (*Fabia*-na: after Francisco Fabiano, 1719–1801, Spanish Archbishop and amateur botanist.)

F. imbricata, Ruiz & Pav. Height 3–8 ft.; branchlets many, erect, puberulous: lvs. numerous, ovate, scale-like, imbricated: fls. sessile or nearly so, borne singly but profusely on the ends of short branchlets; corolla about $\frac{1}{2}$ in. long, much constricted at the base, the lobes short, rounded and reflexed. Peru.

15. **HYOSCYAMUS**, L. **HENBANE**. Erect or prostrate coarse herbs of the Medit. region; about 15 species, one nat. in Amer. and sometimes grown for medicinal uses.—Plant usually hairy, ann., bien., per.: lvs. alternate, coarsely toothed or pinnatifid, rarely entire: fls. axillary, the uppermost forming a leafy cluster or spike; calyx 5-toothed, enlarging in fr.; corolla pallid or lurid and reticulate, funnel-shaped, 5-lobed and sometimes unequally so, often splitting down one side; stamens usually exserted; disk inconspicuous or lacking: caps. more or less 2-celled, circumscissile or sometimes opening by valves. (*Hyoscy*-amus: Greek *hog bean*, supposed to poison swine.)

H. niger, L. Ann. or usually bien., 1–2½ ft. high, with fusiform root: lvs. oblong, 3–8 in. long, irregularly sinuate-toothed or pinnatifid, the lower petiolate, the others more or less clasping and decurrent: fls. 1–2 in. across, subsessile, erect, in simple one-sided terminal spikes; corolla greenish-yellow, purple-veined: caps. about $\frac{1}{2}$ in. long, inclosed in the enlarging calyx: lvs. and flowering tops medicinal.

16. **NICOTIANA**, L. Over 100 species and many subspecies of herbaceous or rarely shrubby or arborescent plants, certain of them valued for their stately habit, rapid growth, and large lvs., others for showy fls.; one is the tobacco; native mostly in N., Cent., and S. Amer., especially in the western trop. part, a few species in the Pacific isls. and Australia.—Annuals or perennials, often viscid-pubescent, strongly scented, possessing narcotic-poisonous properties: lvs. alternate, simple, entire or rarely sinuate, mostly sessile or nearly so by a tapering base: fls. white, yellow, greenish, or purple, usually opening at night and then most fragrant, arranged in a terminal panicle or in elongate one-sided racemes, or the lower solitary in the axils; calyx tubular-campanulate, 5-lobed; corolla with long tube and 5-lobed often oblique limb; stamens 5, included or exserted: caps. 2- or seldom 4-valved, the valves 2-toothed or -cleft; seeds numerous, minute. (*Nicotia*-na: named for Jean Nicot, 1530–1600, French consul to Portugal, who is said to have first presented tobacco to the courts of Portugal and France.)

- A. Shape of fls. funnelform.....1. *N. Tabacum*
- AA. Shape of fls. salverform.....
- B. Lobes of corolla rounded or obtuse.....2. *N. suaveolens*
- BB. Lobes of corolla acute or acuminate.....
- C. Teeth of calyx ovate, acute; corolla entirely white.....3. *N. sylvestris*
- cc. Teeth of calyx linear-acuminate to subulate; corolla colored.....
- D. Color of fls. greenish-yellow and violet.....4. *N. glauca*
- DD. Color of fls. rose.....5. *N. Sanderae*

1. **N. Tabacum**, L. **TOBACCO**. Ann. and herbaceous or sometimes of longer duration and somewhat shrubby at base, viscid-pubescent, erect, branching above: lvs. large, often 1 ft. or more long, oblong-lanceolate, acuminate, sessile, the lower decurrent and half-clasping: fls. diurnal, 1½–2 in. long, pedicelled, bracteate, in short many-fl'd. panicle racemes; calyx oblong, with lanceolate acute unequal segms.; corolla woolly without, funnel-form, the throat somewhat swollen, the rose-colored or red limb with acute lobes: caps. ovoid, $\frac{3}{4}$ in. long, about equalling the calyx. (*Tabacum*: Latinization of an aboriginal

American name from which comes also the word *tobacco*.) Trop. Amer.—Cult. by the Indians from earliest times and often running wild. A striking garden plant and also important commercially as the source of tobacco; there are many cultivars.

2. *N. suaveolens*, Lehm. Ann. or bien., usually viscid, 1–2 ft., the subsimple sts. villous below, glabrous above: basal lvs. subpetiolate, spatulate, obtuse, the cauline ovate-lanceolate, undulate, acute, decurrent on the petiole, the uppermost subsessile: fls. 1–2 in. long, nodding, distant, in terminal bracteate racemes; calyx deeply 5-cleft, pubescent, with narrow unequal acute lobes; corolla greenish-purple, opening at night, fragrant, the limb somewhat 2-lipped and 1–1½ in. across with upper lobes very small, all subrotund, obtuse, or emarginate: caps. ovate, obtuse, included. Australia.

3. *N. sylvestris*, Spegazzini & Comes. Tall per., glandular-hairy throughout, the sts. leafy below, branching above: lvs. rugose, sessile, broadly oblong-spatulate, the lower dilated at base, half-clasping and auricled, somewhat decurrent, rotund or obtuse at apex, the upper acute: fls. in short head-like panicles, drooping, on pedicels nearly equalling the calyx, not closing in the morning on cloudy days; calyx 5-angled, somewhat swollen, with short unequal ovate acute teeth; corolla entirely white, fragrant, salverform, the tube about 3½ in. long, above somewhat inflated, the ovate-triangular often emarginate lobes nearly equal, becoming reflexed. Argentina.

4. *N. alata*, Link & Otto. Per., 3–5 ft., glandular-hairy, with erect branching sts.: lvs. lanceolate or oblong, 3–4 in. or more long, decurrent in narrow wings, more or less repandentate or undulate, acute or obtuse, the upper narrower: fls. in a loose terminal raceme; calyx hirsute, tubular, the 5 lobes subulate and nearly equal; corolla villous, fragrant, opening at night, and closing in cloudy weather, the slender tube yellowish-green, swollen above, four to five times longer than calyx, the limb oblique, nearly 2 in. across, pale violet beneath, white within, with ovate acute or often emarginate lobes; stamens unequal, not exerted: caps. oblong, shorter than the calyx. Brazil, Uruguay, Paraguay.—Perhaps not in cult., the garden form being var. *grandiflora*, Comes (*N. affinis*, Moore), with very large fragrant fls., the corolla-tube much dilated, the limb yellowish without; known only in cult.

5. *N. Sanderæ*, Sander (*N. alata* × *N. Forgetiana*). The red-fl. garden nicotiana: viscid-pubescent ann. 2–3 ft. high, of bushy habit: basal lvs. 6–12 in. long, spatulate, undulate; st. lvs. oblong-lanceolate, short-petioled, acuminate, undulate: fls. bracteolate, in large loose panicles; corolla salverform, the cylindric tube three times as long as the calyx, swollen above, greenish-yellow tinted with rose, the limb oblique, with carmine-rose lobes elliptic, acute, obtuse or often emarginate. Originated in 1903 by Sander & Sons, St. Albans, England.—*N. Forgetiana*, Sander, is an ann. rose-fl. species from Brazil with oblong-lanceolate obtuse wing-petioled lvs. about 1 ft. long, and narrow corolla 1–1¼ in. long, with broad mostly obtuse lobes; probably not in cult. here; procured in Brazil for Messrs. Sander by their collector, Mr. Forget.

17. **DATURA, L.** Large coarse erect plants, several cult. for their great trumpet-like odorous fls.; a dozen to 15 species, mostly with strong-smelling herbage, in the warmer parts of the globe, but some widespread weeds.—Forking bushy annuals, shrubs, or trees, with narcotic principles: lvs. large, simple, entire or coarsely sinuate-dentate: fls. large, axillary and solitary, erect or pendulous, white, red, violet, or yellow; calyx long-tubular, 5-toothed or spathe-like, splitting lengthwise or circumscissile with the base left as a cup on the fr.; corolla trumpet-shaped with spreading plicate limb shortly and broadly lobed, the lobes often acuminate; stamens inserted near the base of the corolla-tube, included or only slightly exerted; style long-filiform, 2-lobed: fr. a large 2-celled (falsely 4-celled) caps. mostly prickly or spiny, usually dry and 4-valved at top but sometimes fleshy and bursting irregularly or indehiscent; seeds large. (Datu-ra: vernacular E. Indian name.)

- A. Fls. erect; calyx circumscissile, the upper part falling off: caps. dehiscent, usually prickly.
- B. Caps. erect, regularly dehiscent.....1. *D. Stramonium*
- BB. Caps. pendulous, irregularly dehiscent.
- C. Plant glabrous.....2. *D. Metel*
- CC. Plant puberulent and somewhat glaucous.....3. *D. meteloides*
- AA. Fls. pendulous; calyx not circumscissile: caps. indehiscent, not prickly. (BRUG-MANSIA, Angels-Trumpet.)
- B. Calyx spathe-like, running to a single point.....4. *D. arborea*
- BB. Calyx toothed at the apex.
- C. Corolla red; anthers separate.....5. *D. sanguinea*
- CC. Corolla white; anthers joined around the style.....6. *D. suaveolens*

1. *D. Stramonium*, L. JIMSON- or JAMESTOWN-WEED. Ann. 1–5 ft. high, glabrous or slightly pubescent: lvs. ovate, 3–8 in. long, with irregular acute lobes: fls. erect; calyx angular, 2 in. long; corolla white or violet, 4 in. long and limb 1½–2 in. across: caps. erect, ovoid, 2 in. long, very prickly, regularly dehiscent into 4 valves. (Stramonium: a pre-Linnæan name.) Tropics; nat. in N. Amer.

2. *D. Metel*, L. (*D. fastuosa*, L. *D. cornucopia*, Hort.). Ann. glabrous herb 4-5 ft. high: lvs. ovate-lanceolate, acuminate or acute, unequal at base, sinuate-toothed or repand, glabrous on both sides, solitary or the upper in pairs with one larger than the other, the larger 7-8 in. long; fls. erect, $6\frac{1}{2}$ -7 in. long; calyx purple, tubular-angulate, 2 in. long, 5-toothed, the teeth triangular-lanceolate, acuminate; corolla white, often violet outside, to yellowish, the limb typically with 5 but sometimes with 6 long-cuspidate acute angles, in cult. often double, the inner corollas 5-10-lobed; stamens 5-6; caps. nodding, globose, short-spiny, $1\frac{1}{4}$ in. diam., irregularly dehiscent. (Metel is an Arabic or E. Indian vernacular name.) India; nat. in the tropics of both hemispheres.—The most frequent garden datura. The color is variable; the plant known as *D. chlorantha*, Hook., has greenish-yellow fls.

3. *D. meteloides*, Dunal (*D. Wrightii*, Hort.). Handsome herbaceous per., 1-3 ft., cult. as an ann., glaucescent and puberulent, grayish, the slender branches forked: lvs. unequally ovate, repand or subentire, acuminate, the upper often in unequal pairs, the larger 2-2 $\frac{1}{4}$ in. long; fls. erect, $5\frac{1}{2}$ -9 in. long; calyx tubular, 3 in. long, with long acute unequal teeth; corolla white tinged with rose or violet, sweet-scented, about twice as long as calyx, with 5 or 10 slender-subulate teeth; caps. nodding, subglobose, 2 in. diam., with long sharp spines, bursting irregularly; seeds narrowly margined. Tex. to Calif. and N. Mex.—Used medicinally and ceremonially by certain Indian tribes.

4. *D. arborea*, L. Small tree: lvs. ovate-lanceolate, oblong or ovate, entire or nearly so, pubescent, in pairs, one a third shorter than the other; petioles 1 in. or more long; fls. with a musk-like odor, nodding, on solitary axillary pedicels; calyx tubular, spathe-like, entire; corolla 6-9 in. long, white with greenish nerves, the limb with very long acuminate lobes; anthers distinct; caps. broad-ovoid, 2 $\frac{1}{2}$ in. long, unarmed. Peruvian Andes.

5. *D. sanguinea*, Ruiz & Pav. Tree-like shrub 4-12 ft. high; branches fragile, leafy at apex: lvs. clustered, 5-7 from the same point, narrow-oblong, acute or acuminate, 7 in. long, pubescent on both sides, shining green above, paler beneath, the lower sinuate-angled, the upper entire; petioles 2 $\frac{1}{2}$ in. long, channelled, pubescent; fls. 8-10 in. long, terminal, peduncled, pendulous, brilliant orange-red with yellow nerves, inodorous; calyx ovate, 5-angled, variegated, one-third as long as corolla; anthers separate: caps. turbinate, 3 $\frac{1}{2}$ in. long, unarmed, at maturity yellow; seeds with narcotic properties. Peru.

6. *D. suaveolens*, Humb. & Bonpl. (*D. Gardneri*, Hook.). Tree-like shrub 10-15 ft. high: lvs. ovate-oblong, petioled, often unequal at base, entire, acute, glabrous, 6-12 in. long; fls. white, 9-12 in. long, nodding, on pedicels $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long; calyx inflated, angled, obscurely 5-toothed; corolla-tube plicate, the limb with 5 short segms.; anthers connate about the style; caps. unarmed, spindle-shaped, about 5 in. long, destitute of calyx. Brazil.—Usually cult. as *D. arborea*.

18. **SCHIZANTHUS**, Ruiz & Pav. BUTTERFLY-FLOWER. Ann. or bien. herbs grown out-of-doors and also in pots for the profusion of showy bloom; about a score of species in Chile.—Erect, branching, more or less glandular-viscid: lvs. frequently pinnatisect or even pinnate, the segms incised or dentate: fls. variously colored, in terminal cymes or panicles; calyx tubular, deeply 5-cleft, with narrow lobes; corolla with long or short tube and spreading almost bilabiate limb, the lobes deeply cut; perfect stamens 2 and exserted, accompanied by 3 staminodia, one of them minute; ovary oblong, 2-celled: caps. with 2-cleft valves; seeds numerous. (Schizanthus: Greek *cut flower*, from the incised corolla.)

- A. Corolla-tube shorter than calyx.
 - B. Stamens prominently exserted from the throat.....1. *S. pinnatus*
 - BB. Stamens little if at all projecting from the throat.....2. *S. wisetonensis*
- AA. Corolla-tube equaling or exceeding the calyx.
 - B. Middle segm. of anterior corolla-lip notched at apex.....3. *S. retusus*
 - BB. Middle segm. not so notched.....4. *S. Grahamii*

1. *S. pinnatus*, Ruiz & Pav. (*S. papilionaceus* and *S. grandiflorus*, Hort.). Thinly hairy and somewhat glandular, $1\frac{1}{2}$ -4 ft. or more, slender-branching: lvs. 1-2-pinnatisect, the segms. entire, toothed or incisely pinnatifid: infl. elongate, of numerous fls. in panicle racemes; fls. $\frac{3}{4}$ -1 $\frac{1}{4}$ in. across, varying in depth of color and markings, the lower lip usually violet or lilac, the upper paler, its middle segm. with a yellow blotch toward base, spotted with purple or violet; corolla-tube shorter than calyx; stamens prominently showing at the throat.—The common and most variable species, with many hort. forms and vars. distinguished by height of st. and color markings of the fls.; sometimes the fls. are bluish or lilac and without spots or streaks.

2. *S. wisetonensis*, Low (*S. pinnatus* \times *S. Grahamii*). Mostly intermediate between the parents, the fls. resembling *S. Grahamii* in outline, varying in color from white through bluish and pink to carmine-brown, the mid-lobe of the upper lip often suffused with yellow; corolla-tube seemingly shorter than calyx; stamens usually rather short-exserted: foliage and habit like *S. pinnatus*.

3. *S. retusus*, Hook. Branching but rather stocky, 2-2½ ft. high, the sts. finely hairy or nearly glabrous; lvs. petioled, 5 in. or more long, unequally pinnatisect, the segms. incised or dentate; fls. solitary in the axils on long glandular-hairy pedicels or forming a large loose terminal panicle; calyx glandular-hairy; corolla 1-1½ in. across, the tube as long as the calyx or longer, the large middle segm. of the upper lip orange except at the emarginate tip, the lateral segms. of the posterior lip falcate, acute, linear, longer than the middle segm.; stamens short-exserted.—There are several vars. differing in color, sometimes almost clear white.

4. *S. Grahamii*, Gill. Glabrous, 1½-5 ft. high; lvs. 1-2-pinnatisect, the segms. entire or toothed-pinnatifid; fls. typically lilac or rose; corolla-tube as long as the calyx; middle segm. of anterior lip not notched at apex, its central portion yellow or orange; lateral segms. of posterior lip falcate, linear, acute, shorter than the middle segm.; stamens short-exserted. (Presumably named for Robt. Graham, page 44).—There are vars. with white, flesh-colored, lilac, rose, or carmine fls.; apparently not common.

19. **NIEREMBERGIA**, Ruiz & Pav. CUP-FLOWER. Subshrubs and low per. herbs with showy white or pale fls., grown in the open border and as pot-plants, ordinarily treated as annuals; about 30 species from trop. and subtrop. Amer., allied to *Petunia* and characterized by the long and very slender corolla-tube.—Decumbent or creeping, sometimes erect, mostly glabrous, diffusely branched, the branches slender; lvs. alternate, scattered, simple and entire; fls. white to deep violet, often with purple center, borne singly at or near the tips of the branchlets; calyx tubular or campanulate, 5-parted; corolla with slender elongate tube abruptly expanded above, the limb with 5 broad lobes; stamens inserted on the upper part of the corolla-tube, more or less exserted, 4 of them paired, the fifth smaller: caps. 2-valved, the valves mostly 2-cleft. (Nierembergia: for Juan Eusebio Nieremberg, 1595-1658, a Spanish Jesuit and first professor of natural history at Madrid.)

- A. Lvs. oblong or spatulate, ¼-1 in. wide; sts. creeping and rooting at nodes 1. *N. repens*
 AA. Lvs. linear, less than ¼ in. wide: sts. erect or ascending, not rooting at nodes.
 B. Pedicels at anthesis about ¼ in. long: plant suffrutescent 2. *N. frutescens*
 BB. Pedicels at anthesis about ½-¾ in. long: plant herbaceous.
 C. Stamens ¼-½ in. long; corolla-limb ½-¾ in. long, bright blue 3. *N. hippomanica*
 CC. Stamens about ½-¾ in. long; corolla-limb ¾ in. long, white tinged with pink var. *violacea*
 or purple.
 D. Lf. less than ¼ in. wide, ¾-¾ in. long 3. *N. hippomanica*
 DD. Lf. ½-¾ in. wide, ½-1 in. long 4. *N. gracilis*

1. *N. repens*, Ruiz & Pav. (*N. spatulata*, HBK. *N. rivularis*, Miers). WHITE-CUP. Glabrous throughout, the slender creeping sts. rooting freely at the nodes and forming a dense mat, branches seldom rising over 6 in. high; lvs. membranaceous, oblong to oblong-spatulate, ¾-1½ in. long, ¼-½ in. wide, with long slender petioles; fls. sessile or short-pedicelled, creamy-white sometimes tinged rose or blue; calyx cylindric, lobes oblong-lanceolate, slightly spreading; corolla-limb broadly bell-shaped, 1-2 in. broad, with golden-yellow throat, the tube 1-2 in. long. Argentina, Chile, Uruguay.

2. *N. frutescens*, Dur. (*N. fruticosa*, Hort.). TALL CUP-FLOWER. Puberulent or nearly glabrous, 1-3 ft. high, shrubby, much-branched; lvs. scattered, linear, ½-1½ in. long, ¼-¾ in. wide; fls. about 1 in. across, the saucer-shaped limb white tinted with lilac or blue, throat yellow, tube scarcely or somewhat longer than calyx. Chile.—Valuable in the greenhouse or for the border, or as a pot-plant blooming almost continuously. There are vars. with white or purple fls., also with larger ones.

3. *N. hippomanica*, Miers. Small pubescent herb 3-6 in. high; lvs. linear-spatulate, ¾-¾ in. long, to ¼ in. wide; pedicels about ¼ in. long; calyx about ¼ in. long; corolla-tube ¾ in. long, limb slightly longer, white tinged rose; stamens unequal, about ¾ in. long. Argentina.—The plant common in cult. is var. *violacea*, Millan (var. *cærulea*, Millan. *N. cærulea*, Sealy not Miers). Plant 4-12 in. high, scabrous-pubescent, with suberect branches; lvs. solitary and fascicled, lanceolate-spatulate, ½-1 in. long, less than ¼ in. wide; pedicels at anthesis about ¼ in. long; calyx about ¼ in. long; corolla bright blue; stamens subequal, ¼-¾ in. long.

4. *N. gracilis*, Hook. (*N. filicaulis*, Hort. *N. calycina*, Hort. not Hook.). Branches very slender, ascending 6-15 in., slightly downy; lvs. scarcely ½ in. long, linear or only sub-spatulate, those on the younger branches somewhat hairy; pedicels ½-¾ in. long at anthesis; corolla-limb spreading, convex, about 1 in. across, white tinged and veined with purple toward the center and throat yellow, tube ¾-¾ in. long. Argentina.

20. **PETUNIA**, Juss. Fl.-garden annuals, or grown as such for their showy bloom; over 25 species, mostly natives of the southern part of S. Amer., some with small not attractive fls.—Branching viscid-pubescent annuals or perennials, of weak or

straggling growth: lvs. soft, simple and entire, alternate or the upper opposite: fls. white or in shades of pink to purple, on solitary, terminal or axillary peduncles; calyx deeply 5-cleft, the lobes oblong or linear, obtuse; corolla funnelform or salverform, the long tube straight or nearly so and fitting loosely in the calyx, limb broad and normally 5-lobed, equal or oblique or obscurely 2-lipped; stamens 5, inserted on or below the middle of corolla-tube, 4 in pairs, the fifth much smaller or rudimentary: caps. 2-celled, the 2 valves undivided; seeds small, many. (*Petunia*: from a S. American aboriginal name.)

- A. Fls. dull white, the tube long and narrow.....1. *P. axillaris*
 AA. Fls. usually colored, the tube short and broad.
 B. Sts. very slender: fls. rose-red or violet, about 1 in. long.....2. *P. violacea*
 BB. Sts. stocky: fls. of various colors, larger.....3. *P. hybrida*

1. *P. axillaris*, BSP. (*P. nyctaginiflora*, Juss.). LARGE WHITE PETUNIA. Tall and relatively stout, usually erect, 1-2 ft.: lvs. large and rather thick, oval-oblong, the upper sessile or nearly so, the lower narrowed into a distinct petiole: fls. dull white, 2-2½ in. long, fragrant at evening, the cylindrical tube three to four times as long as calyx. Argentina.—Frequently seen in old gardens and also escaped.

2. *P. violacea*, Lindl. VIOLET-FLOWERED PETUNIA. Glandular-hairy, viscid, sts. 6-10 in. long, slender, branching, prostrate or the tips erect: lvs. ovate, shortly petioled, acute, the upper ovate-lanceolate, the floral in pairs: fls. 1-1½ in. long, rose-red or violet, the tube lighter; calyx deeply 5-parted into linear segms. about half or more as long as the funnel-shaped corolla-tube; corolla with subequal limb, the lobes ovate and acute. Argentina.—This species and its garden derivatives sometimes persist for a time as escapes.

3. *P. hybrida*, Vilm. COMMON GARDEN PETUNIA. Cultigen; apparently a series of hybrids from the two preceding, remarkably variable but differing from either parent, although varying toward either one: fls. 2-3½ in. long, with funnel-shaped tube and mostly very broad limb; tube broader than in *P. axillaris*, longer with broader limb than in *P. violacea*; from both it differs in the much larger and multiflorous fls. in various colors and more stocky growth. The various strains have fls. varying in size, form and color, sometimes measuring 4-5 in. across, often deeply fringed or full double, ranging from white to deep red-purple, variously striped and barred or with star-like markings radiating from the throat; the group comprises all the highly developed garden petunias.

21. *SALPIGLOSSIS*, Ruiz & Pav. A tall erect fl.-garden ann. and 7 or 8 other species, native of Chile.—Ann., bien. or per., glandular-hairy, with sts. erect: lvs. alternate, simple, entire, sinuate-dentate or pinnatifid: fls. few, mostly large, long-pedicelled; calyx tubular, 5-lobed; corolla funnelform with wide throat, the limb with 5 emarginate lobes; stamens 4, didynamous, included, the fifth wanting or represented by a staminode: caps. oblong or ovoid, the valves 2-cleft; seeds small. (*Salpiglossis*: Greek *tube* and *tongue*, alluding to the form of the corolla and the appearance of the style.)

S. sinuata, Ruiz & Pav. (*S. variabilis*, *S. hybrida*, *S. grandiflora*, *S. gloxiniaeflora* and *S. superbissima*, Hort.). PAINTED-TONGUE. Branching ann. 1-2½ ft. high: lower lvs. petiolate, elliptic, sinuately toothed or pinnatifid; upper lvs. lanceolate or linear, entire or nearly so, subsessile, passing into the bracts of the infl.: fls. 2-2½ in. long and as wide, ranging from straw-color, primrose and yellow through scarlet nearly to blue, with great variation in venation and rich markings.—Several hort. vars. are offered, differing in color of fls.; perhaps other species have entered into some of these forms.

22. *BRUNFELSIA*, L. (*Franciscea*, Pohl). Woody plants, a few grown for the showy or fragrant bloom in warm glasshouses and out-of-doors in the far S.; species about 30 in Cent. and S. Amer. and W. Indies.—Shrubs or small trees: lvs. alternate, simple and entire, often thick and glossy: fls. in loose or dense terminal cymes or solitary, mostly large or at least showy, often fragrant, commonly blooming under glass in winter; calyx tubular or campanulate, 5-toothed or -cleft; corolla funnelform, the tube long, the limb with 5 broad obtuse lobes; stamens 4, inserted on the corolla-tube, included, didymous, all with anther-cells alike; ovary sessile, 2-celled, many-ovuled: fr. capsular or berry-like, with undivided valves. (*Brunfelsia*: Otto Brunfels, physician and first German botanist, died 1534.)—Originally spelled *Brunfelsia* by Linnæus but subsequently corrected by him to *Brunfelsia*.

A. Corolla violet, purple, or blue, at least on tube (or fading lighter), nearly or quite inodorous.

B. Calyx long-tubular, half or more the length of the corolla-tube. 1. *B. calycina*

BB. Calyx short, split nearly or quite to the base. 2. *B. latifolia*

AA. Corolla white or yellowish, very fragrant at night. 3. *B. americana*

1. *B. calycina*, Benth. Erect or spreading, branching: lvs. short-petioled, ovate-oblong or elliptic, 3-4 in. long, acute, glabrous or nearly so, dark green above, pale green below: fls. rich dark purple, mostly inodorous, in few-fl. usually terminal cymes; calyx tubular, inflated, light green, $\frac{3}{4}$ -1 in. long, rather bluntly short-lobed; corolla-limb 2 in. diam., the broadly 5-lobed limb with slightly wavy margins. Brazil. Var. *eximia*, Raffill, free-flowering, slightly downy throughout, intermediate in size between the type and var. *macrantha*: branches mostly short and spur-like: lvs. elliptic, acutish or obtuse: fls. rich purple on first opening, soon fading to almost pure white, about $1\frac{1}{2}$ in. diam., in 2-5-fl. clusters; calyx slender, slightly curved, hairy, about $1\frac{1}{4}$ in. long. Var. *floribunda*, Raffill (*B. floribunda*, Hort.), dwarf floriferous free-branching shrub, glabrous throughout: lvs. 2-4 in. long, elliptic, rich dark green, prominently veined beneath: fls. rich violet with small white eye, produced rather early in the year, on stout pedicels $\frac{1}{2}$ in. long; calyx $\frac{5}{8}$ in. long, elliptic in outline; corolla-limb flat or nearly so. Var. *macrantha*, Raffill (*B. macrantha*, Lem. *B. grandiflora*, Don), floriferous shrub for a warm greenhouse or sub trop. country, of strong vigorous growth, glabrous or nearly so: lvs. rich dark green, often 8 in. long and $2\frac{1}{2}$ in. broad: cymes dense, terminal or in the axils of all the upper lvs.; calyx 1 in. long, bright green; corolla $2\frac{1}{2}$ -3 in. diam., rich deep purple, with prominent lavender-blue ring surrounding the white eye at mouth of tube; Peru.

2. *B. latifolia*, Benth. Rather dwarf, with slender branches: lvs. elliptic, much as in no. 1: fls. nearly white to lavender and purple with lighter center, solitary or few in a cluster, the corolla-limb $1\frac{1}{2}$ in. across and the lobes obtuse; calyx not inflated, about $\frac{1}{2}$ in. long, cleft nearly or quite to the base, the lobes acute and reaching only one-third length of corolla-tube. Trop. Amer.

3. *B. americana*, L. LADY-OF-THE-NIGHT. Shrub 4-8 ft., twigs puberulent or glabrous: lvs. mostly elliptic to elliptic-ovate or -obovate, $1\frac{1}{2}$ -4 in. long, entire, tapering to short petiole, apex acute, obtuse or even emarginate: fls. mostly solitary, terminal and axillary, very slender tube $2\frac{1}{2}$ -4 in. long, limb $1\frac{1}{2}$ -2 in. across, opening yellowish and becoming white, powerfully sweet-fragrant; calyx short and nearly truncate: fr. a yellowish berry $\frac{3}{4}$ in. diam. W. Indies.

23. *BROWALLIA*, L. About a half dozen mostly blue-fl. trop. American herbs, some cult. for the profuse bloom.—Annuals, glabrous or glandular: lvs. nearly or quite simple: fls. blue, violet, or sometimes white, solitary and axillary or in more or less one-sided racemes; calyx mostly 5-toothed; corolla with long straight slender 15-nerved tube and spreading 5-lobed more or less irregular limb; stamens 4, didymous, inserted above the middle of the corolla-tube, the anthers of the shorter pair with 1 cell undeveloped, fifth stamen sometimes represented by a rudiment: caps. with 2-lobed valves, included in calyx. (Browallia: after Johan Browallius, 1707-1755, Bishop of Abo, and botanist, Sweden.)

A. Corolla-segms. long, not notched, some of them acute or acuminate; tube 1 in. long. 1. *B. speciosa*

AA. Corolla-segms. short, 2-lobed or -notched; tube $\frac{3}{4}$ in. long or less.

B. Calyx hairy. 2. *B. americana*

BB. Calyx sticky or clammy. 3. *B. viscosa*

1. *B. speciosa*, Hook. (*B. major*, Hort.). Glabrous or nearly so, half-shrubby, 2-5 ft. high: lvs. ovate, acute, opposite or alternate: fls. solitary, axillary, on pedicels shorter than lvs.; corolla-tube at least 1 in. long, two to three times as long as calyx, abruptly swollen at the top beneath the limb; limb outspreading, of 5 ovate striate dark purple entire segms., pale lilac beneath, $1\frac{1}{2}$ -2 in. across up and down. Colombia.—There are blue-, violet-, and white-fl. vars.

2. *B. americana*, L. (*B. demissa*, L. *B. elata*, L.). Branching, 1-2 ft. high; sts. and lvs. pubescent or glabrous: lvs. ovate, rotund, cuneate or rarely cordate, petioled: fls. solitary and axillary below, racemose above; calyx hairy, the teeth unequal, acute and much shorter than the corolla-tube; corolla about $\frac{1}{2}$ in. long and broad, blue, violet, or, in some forms, white, the short segms. bifid. Trop. Amer.

3. *B. viscosa*, HBK. (*B. pulchella*, Hort.). Viscous and glandular-hairy, about 1 ft. high, stiffer in habit than *B. americana* and fls. more numerous: lvs. short-petioled, ovate, rough-hairy on both sides: lower fls. solitary in the axils, the upper racemose; pedicels a little shorter than the calyx; calyx-teeth very clammy, oblong, shorter than the corolla-tube; corolla dark blue with a white eye (varying to white), not over $\frac{3}{4}$ in. long, the short segms. bifid. S. Amer.

24. *STREPTOSOLEN*, Miers. One evergreen shrub, native in Colombia and Ecuador, with large clusters of orange-red fls., suitable for greenhouse culture and

for out-of-doors in mild climates.—Lvs. alternate, simple, entire, not large, rugose and veiny: fls. in a terminal corymbose panicle; calyx tubular-campanulate, shortly 5-cleft; corolla-tube elongated, somewhat twisted as shown by the spiral direction of the nerves at the base of the corolla, inside the calyx and upward, widening above, the spreading limb with 5 broad obtuse lobes; perfect stamens 4, didymous, the anthers of the shorter pair with 1 cell not developed; ovary stipitate, 2-celled: caps. somewhat leathery, the 2 valves 2-cleft. (Streptosolen: Greek *twisted* and *tube*, with reference to the form of the corolla-tube.)

S. Jamesonii, Miers. Scabrous-pubescent plant, 4-6 ft., with long flexuose branches on the ends of which the clusters of fls. are borne: lvs. petioled, oval, $1\frac{1}{2}$ in. long or less, obtuse or acute: corolla $1-1\frac{1}{4}$ in. long, the limb darker colored. (Named for Dr. Wm. Jameson, who sent specimens of this plant to Kew.)

Fig. 179. SCROPHULARIACEÆ. A. *Antirrhinum majus*: Aa, flowers, $\times \frac{1}{2}$; Ab, flower, vertical section, perianth partially excised, $\times 1$. B. *Calceolaria crenatiflora*: Ba, portion of inflorescence, $\times \frac{1}{2}$; Bb, flower, vertical section, $\times 1$. C. *Torenia Fournieri*: Ca, flowering branch $\times \frac{1}{2}$; Cb, flower, side view, $\times \frac{1}{2}$; Cc, flower, perianth expanded and partially excised, $\times \frac{1}{2}$. D. *Veronica longifolia*: Da, inflorescence, $\times \frac{1}{2}$; Db, flower, $\times 2$; Dc, same, vertical section, $\times 3$; Dd, capsule, $\times 2$; De, ovary, cross-section, $\times 10$. E. *Pentstemon lævigatus*: Ea, inflorescence, $\times \frac{1}{2}$; Eb, flower, vertical section, $\times 1$.

179. SCROPHULARIACEÆ. FIGWORT FAMILY

Herbs, shrubs, or trees, of about 190 genera and 3,000 or more species widely distributed over the earth, many grown for ornament.—Lvs. alternate, opposite, or verticillate, exstipulate: fls. bisexual, usually irregular, the infl. various; calyx 4-5-toothed or divided, persistent; corolla gamopetalous, rotate or broadly campanulate or with cylindrical tube, the limb 4-5-lobed, equally spreading or bilabiate; stamens usually 4, didynamous, inserted on corolla-tube and alternate with its lobes, or sometimes 2 or 5 or the fifth stamen sterile or reduced to a gland; hypo-

SCROPHULARIACEÆ

gynous disk present or obsolete; ovary superior, perfectly or imperfectly 2-celled, usually with many ovules in each cell, style entire or 2-lobed: fr. a caps. or berry.

- A. Number of stamens 2.
 - B. Corolla 2-lipped, the lower lip inflated and slipper-like..... 1. CALCEOLARIA
 - BB. Corolla with spreading 4-5-lobed limb.
 - C. Calyx 2-lipped or -parted.....24. ZALUZIANSKYA
 - CC. Calyx 4-5-parted.
 - D. Lvs. basal.
 - E. Lobes of calyx 5..... 2. WULFENIA
 - EE. Lobes of calyx 4..... 3. SYNTHIRIS
 - DD. Lvs. cauline.
 - E. Foliage persistent; plant woody..... 4. HEBE
 - EE. Foliage deciduous; plant (ours) herbaceous.
 - F. Tube of corolla shorter than lobes: lvs. mostly opposite..... 5. VERONICA
 - FF. Tube of corolla much longer than lobes: lvs. in whorls of 3-5..... 6. VERONICASTRUM
 - AA. Number of stamens 4-5.
 - B. Anther-bearing stamens 5..... 7. VERBASCUM
 - BB. Anther-bearing stamens 4 (rarely 8).
 - C. Habit climbing.....19. MAURANDYA
 - CC. Habit not climbing.
 - D. Sterile stamen evident.
 - E. Staminate as long as fertile stamens: seeds wingless..... 8. PENSTEMON
 - EE. Staminate shorter than fertile stamens: seeds winged..... 9. CHELONE
 - DD. Sterile stamen lacking or gland-like.
 - E. Calyx spathe-like.
 - F. Lvs. entire or toothed.....10. HEBENSTRETTIA
 - FF. Lvs. pinnatisect.....13. PEDICULARIS
 - EE. Calyx not spathe-like.
 - F. Lvs. all alternate.
 - G. Corolla-tube none.....11. CELSIA
 - GG. Corolla with tube.
 - H. Throat closed by prominent palate: plant creeping.....21. CYMBALARIA
 - HH. Throat not closed by palate: plant usually erect.
 - I. Lobes of calyx not more than half its length.
 - J. Length of corolla 2 in. or more.....12. REHMANNIA
 - JJ. Length of corolla 1 in. or less.....13. PEDICULARIS
 - II. Lobes of calyx extending nearly to base.
 - J. Corolla-lobes 5.
 - K. Plant a low herb.....14. ERINUS
 - KK. Plant a shrub.....15. LEUCOPHYLLUM
 - JJ. Corolla-lobes 2.
 - K. Length of corolla 1 in. or more.
 - L. Upper lip of corolla shorter than under lip.....16. DIGITALIS
 - LL. Upper lip of corolla as long as or longer than under lip.....17. ISOPLEXIS
 - KK. Length of corolla about $\frac{1}{2}$ in.....18. ANARRHINUM
 - FF. Lvs. opposite or verticillate or sometimes upper lvs. alternate.
 - G. Plant an herb or shrub.
 - H. Corolla-tube long.
 - I. Throat with a prominent palate.
 - J. Fls. neither saccate nor spurred at base.....26. MIMULUS
 - JJ. Fls. saccate or spurred at base.
 - K. Corolla saccate or gibbous at base.....20. ANTIRRHINUM
 - KK. Corolla spurred at base.
 - L. Veining of lvs. palmate: fls. solitary.....21. CYMBALARIA
 - LL. Veining of lvs. pinnate: fls. in racemes or spikes.
 - M. The plant glabrous or nearly so: throat nearly closed by palate.....22. LINARIA
 - MM. The plant glandular-pubescent: throat not closed by palate.....23. CHÆNORRHINUM
 - II. Throat without palate.
 - J. Calyx 2-lipped or 2-parted.....24. ZALUZIANSKYA
 - JJ. Calyx 5-lobed or -parted.
 - K. Lobes of calyx shallow; calyx tubular.
 - L. Ribs of calyx winged.....25. TORENIA
 - LL. Ribs of calyx wingless.....26. MIMULUS
 - KK. Lobes of calyx to middle or below; calyx not tubular.
 - L. Sts. creeping.....27. MAZUS
 - LL. Sts. erect.
 - M. Stamens exserted.....28. PHYGELIUS
 - MM. Stamens included.....29. RUSSELLIA
 - HH. Corolla-tube very short or none.
 - I. Tube of corolla none.
 - J. Under lip 2-spurred.....30. DIASCIA
 - JJ. Under lip not 2-spurred.
 - K. Corolla turned upside down by torsion of pedicel.....31. ALONSOA
 - KK. Corolla not turned upside down.....32. ANGELONIA
 - II. Tube of corolla short.
 - J. Calyx parted to base: sterile stamen lacking.....33. NEMESIA
 - JJ. Calyx not parted to base: sterile stamen gland-like.....34. COLLINSIA
 - GG. Plant a tree, with large ovate pubescent lvs.....35. PAULOWNIA

1. **CALCEOLARIA**, L. (*Fagelia*, Schwencke). SLIPPERWORT. Some 300 herbs and shrubby plants, a few cult. for the odd and showy saccate fls.; nearly all are native from Mex. to the Andes of Peru and Chile.—Lvs. opposite or verticillate, simple or pinnate: fls. bisexual, in irregular cymes, mostly yellow, sometimes purple, often oddly spotted; calyx 4-parted; corolla strongly irregular, 2-parted, the upper lip small and ascending and usually more or less saccate, under which are borne the essential organs, the lower lip in the cult. kinds very large and inflated and more or less slipper-like (whence the name *calceolus*, Latin “slipper”); stamens 2; style short, the stigma entire or only obscurely 2-lobed: fr. a septicidal caps. splitting at the top; seeds many and minute.

A. Lvs. pinnatisect or pinnate 1. *C. scabiosæfolia*
 AA. Lvs. not lobed.

B. Height of plant 2–6 ft.

c. Plant herbaceous: lvs. very large and soft, ovate 2. *C. crenatiflora*

cc. Plant woody: lvs. small, mostly on the oblong or lanceolate order 3. *C. integrifolia*

BB. Height of plant 2–8 in.

c. Shape of lvs. lanceolate 4. *C. polyrrhiza*

cc. Shape of lvs. broad-ovate 5. *C. tenella*

1. **C. scabiosæfolia**, Roem. & Schult. Ann. pilose herb, 1–2 ft., branching: lvs. variously pinnatisect or pinnate, 5–8 in. long, the bases of petioles connate across the st. by membrane or projecting ridge; lfts. or segms. 2–3 pairs, ovate to broad-lanceolate, dentate or pinnatifid: fls. many, small, $\frac{1}{2}$ in. across more or less, pale yellow, the slipper usually ob-ovate; summer. Ecuador to Chile.—Infrequently grown. *C. chelidonioides*, HBK., with which this species may be confused and which is to be looked for in cult., is sparsely hairy only above, and the petioles not connate, fls. larger.

2. **C. crenatiflora**, Cav. Stout branchy herbaceous plant 1–2½ ft. high, soft-hairy: lvs. simple, large and soft, ovate to broad-ovate, obtuse or with only a short bluntness point, sinuate or dentate, basal ones petioled and 4–8 in. long, cauline becoming sessile and successively smaller: fls. hanging on slender pedicels, in corymbs, $\frac{3}{4}$ in. or more long, yellow and with orange-brown spots on the large much-inflated crenate or fluted lower lip; upper lip not exceeding the broad-ovate green calyx-lobes. Chile.—Source of the common florists’ herbaceous calceolarias in different races; probably some of the current cult. strains are the result of hybridization (*C. herbeohybrida*, Voss), the parentage now being a matter of conjecture. The material grown as *C. multifloranana* belongs here.

3. **C. integrifolia**, Murr. (*C. rugosa*, Ruiz & Pav.). Sts. woody, the plant becoming a subshrub 2–6 ft., more or less branched, the young parts viscid-scurfy or -pubescent, dark brown: lvs. simple, rather firm, oblong or sometimes oval, 1–3 in. long and 1 in. or more broad, rugose, acute or obtuse, narrowed to short petiole, margins crenate-serrate: fls. short-pedicelled, in rather close peduncled clusters, yellow to red-brown, not spotted, the globular or short-oblong lip about $\frac{1}{2}$ in. across. Chile. Var. **angustifolia**, Lindl. (*C. angustifolia*, Sweet), lvs. lanceolate and more acute, about $\frac{1}{2}$ in. or less broad.—Common under glass and planted out; there are named cultivars, as *C. Lymanii* and *C. Stewartii*. Some cult. forms are probably hybrids (*C. fruticohybrida*, Voss) of obscure derivation.

4. **C. polyrrhiza**, Cav. Dwarf tufted per. to 2 in., sparsely hairy: lvs. crowded at base of st., lanceolate, to 2½ in. long; narrowed into long petiole, entire: fls. solitary on scapes to 4 in. long, yellow spotted purple, 1 in. long and $\frac{1}{2}$ in. wide. Chile.—Hardy, with protection, to N. Y.

5. **C. tenella**, Poeppig & Endl. Low creeping subshrub to 8 in. high, sparsely hairy: lvs. broad-ovate, to $\frac{1}{2}$ in. long, very short-petioled or sessile, obtuse, remotely toothed: fls. usually 2–3 on peduncles to 6 in. long, yellow, spotted within, to $\frac{1}{2}$ in. long. Chile.—Hardy on Pacific Coast, if protected.

2. **WULFENIA**, Jacq. Per. herbs hardy in rock-gardens or borders; about 8 species in Eu. and Asia.—Lvs. basal, petioled, crenate: fls. in spikes or racemes at top of simple scape-like peduncles, nodding, blue; calyx 5-parted; corolla with cylindrical tube and 4-lobed limb; stamens 2; caps. septicidally and loculicidally dehiscent, 4-valved; seeds many. (Wulfenia: F. X. Wulfen, 1728–1805, botanist.)

W. carinthiaca, Jacq. Basal lvs. oblong, to 8 in. long, short-petioled, obtuse, double-crenate, glabrous or sparsely hairy on veins beneath, dark green, shining; st.-lvs. few, small, scale-like: fls. in dense spike-like racemes on scapes 1–2 ft. high; pedicels very short; corolla deep blue-violet, to $\frac{1}{2}$ in. long, with long tube and short lobes. Mts. of Carinthia.

3. **SYNTHYRIS**, Benth. W. N. American per. herbs of 14 species, one grown in the border.—Rootstock thick; lvs. basal, petioled, toothed or pinnatisect: fls. blue or purple, in racemes on simple scape-like peduncles bearing few bract-like lvs.;

calyx 4-parted; corolla campanulate, with very short tube and deeply 4-lobed limb; stamens 2, exserted; caps. compressed, loculicidal; seeds many or few. (Syn-thyris: Greek *together* and *little door*, referring to the valves of the caps. adhering to the placenta.)

S. reniformis, Benth. (*S. rotundifolia*, Gray). Lvs. orbicular-cordate to reniform, 2-3 in. long, on petioles to 4 in. long, doubly crenate, glabrous or slightly pubescent; fls. blue to white, in racemes on scapes 5-9 in. high; corolla about $\frac{1}{2}$ in. long. Wash. to Calif. Var. **cordata**, Gray (*S. rotundifolia* var. *Sweetseri*, L. F. Henderson), has more deeply lobed ovate-cordate lvs. and deeper blue fls.

4. HEBE, Comm. About 140 species of shrubs or small trees native mostly in New Zeal., often planted in temp. climates.—Lvs. persistent and leathery, leaving conspicuous scars, opposite: fls. white or pink, in axillary racemes or small heads; calyx usually 4-parted; corolla with short tube and commonly 4-lobed spreading limb; stamens 2, exserted; ovary (and caps.) elliptic in cross-section with septum extending lengthwise, not crosswise: caps. septicidally dehiscent; seeds few or many. (He-be: Greek for *small*.)

- A. Margin of lvs. coarsely serrate. 1. *H. Hulkeana*
- AA. Margin of lvs. entire.
 - B. Lvs. strictly scale-like. 2. *H. cupressoides*
 - BB. Lvs. not scale-like.
 - C. Length of lvs. 2 in. or more.
 - D. Racemes broad and dense, not much longer than lvs.: lvs. obovate, obtuse. 3. *H. speciosa*
 - DD. Racemes slender, longer than lvs.: lvs. lanceolate, acute. 4. *H. salicifolia*
 - CC. Length of lvs. rarely more than 1 in.
 - D. Fls. spicate: lvs. imbricate.
 - EE. Lf. very short-petioled, keeled by prominent midrib. 5. *H. buxifolia*
 - EE. Lf. sessile and somewhat amplexicaul, not keeled, nerveless. 6. *H. amplexicaulis*
 - DD. Fls. racemose: lvs. not imbricate.
 - E. Diam. of fls. $\frac{1}{2}$ in. or more. 7. *H. elliptica*
 - EE. Diam. of fls. $\frac{1}{4}$ in. 8. *H. Traversii*

1. **H. Hulkeana**, Andersen (*Veronica Hulkeana*, F. Muell.). Laxly branched shrub 1-3 ft. high: lvs. in distant pairs, ovate or oblong-ovate, 1-2 in. long, coarsely serrate, dark green and glossy, petioles to $\frac{1}{2}$ in. long: panicle terminal, much-branched, 6-12 in. long; fls. numerous, small, about $\frac{1}{4}$ in. across, sessile, pale lilac: caps. twice as long as calyx.

2. **H. cupressoides**, Cockayne & Allan (*Veronica cupressoides*, Hook. f.). Globose closely branched shrub 3-6 ft. high; branches very slender, clothed with decussate scale-like lvs. resembling cypress: lvs. in distant pairs, ovate-oblong, $\frac{1}{4}$ in. or less long, rather fleshy; fls. in small terminal heads, small, $\frac{1}{16}$ in. or less diam., bluish-purple or rarely white, sessile: caps. $\frac{1}{2}$ in. long, about twice as long as calyx, obovoid, narrow.

3. **H. speciosa**, Cockayne & Allan (*Veronica speciosa*, R. Cunn.). Stout glabrous shrub 2-5 ft. high, with spreading leafy branches: lvs. obovate or obovate-oblong, 2-4 in. long, almost sessile, rounded at apex, entire, thick, dark green and glossy: racemes axillary, near tips of branches, broad and dense, to $1\frac{1}{2}$ in. across, not much longer than lvs.; fls. $\frac{1}{2}$ in. diam., reddish-purple: caps. more than twice as long as calyx.—A variable species running into color and variegated forms. It hybridizes freely; the best known garden hybrid is **H. Andersonii**, Cockayne (*Veronica Andersonii*, Lindl. & Paxt. *H. salicifolia* \times *H. speciosa*), intermediate between the parents, lvs. narrower and thinner than in *H. speciosa* but broader than in *H. salicifolia*; infl. with fls. white at bottom and rich violet at top; raised by Mr. Anderson near Edinburgh. **H. imperialis**, Cockayne, is probably a product of the same cross.

4. **H. salicifolia**, Pennell (*Veronica salicifolia*, Forst.). Much-branched shrub 2-10 ft. high: lvs. almost sessile, lanceolate, 2-6 in. long, acute, entire, glabrous, rather thin: racemes slender, longer than lvs., many-fld.; fls. $\frac{1}{4}$ in. or less diam., white tinged with lilac or blue: caps. about twice as long as calyx.—Very variable, appearing in many vars. It hybridizes freely with related species.

5. **H. buxifolia**, Cockayne & Allan (*Veronica buxifolia*, Benth.). Stout glabrous shrub to 5 ft.: lvs. closely imbricate, broadly oblong-obovate, to $\frac{1}{2}$ in. long, truncate at base with very short petiole, keeled by the prominent midrib, entire, very thick, dark green and glossy above, paler and usually minutely dotted beneath: fls. white, $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., sessile, in spikes in the axils of the upper lvs. forming a corymbose head: caps. almost twice as long as calyx.

6. **H. amplexicaulis**, Cockayne & Allan (*Veronica amplexicaulis*, Armstr.). Erect or decumbent shrub to 3 ft., with spreading branches: lvs. imbricate, oblong or elliptic-oblong, $\frac{1}{2}$ -1 in. long, obtuse, sessile and somewhat amplexicaul at base, nerveless and not keeled, very thick and glaucous: fls. white, $\frac{1}{4}$ in. diam., sessile, in stout dense-fld. spikes 1-1 $\frac{1}{2}$ in. long in axils of upper lvs.: caps. longer than calyx.

7. *H. elliptica*, Pennell (*Veronica elliptica*, Forst. *V. decussata*, Ait.). Much-branched shrub or small tree 5-20 ft. high, glabrous: lvs. elliptic-oblong, $\frac{1}{2}$ -1 in. long, apiculate, petiolate, close-set, truncate at base, midrib prominent beneath, entire, margins edged with white pubescence, thick, pale green: racemes near tips of branches, 4-12-fl., to $1\frac{1}{2}$ in. long; fls. $\frac{1}{3}$ - $\frac{2}{3}$ in. diam., white with purple lines, sweet-scented: caps. twice as long as calyx. New Zeal., subantarctic S. Amer.

8. *H. Traversii*, Cockayne & Allan (*Veronica Traversii*, Hook. f.). Dense glabrous shrub forming round bush 3-5 ft. diam.: lvs. elliptic- to linear-oblong, $\frac{1}{2}$ -1 in. long, acute, petiolate or nearly sessile, entire, thick: racemes near tips of branches, 1-3 in. long, many-fl.; fls. $\frac{1}{4}$ in. diam., white: caps. twice as long as calyx. (Named for W. T. L. Travers, page 595.)

5. **VERONICA**, L. SPEEDWELL. About 150 species of herbs or subshrubs, distributed over temp. and cold regions, but rare in the tropics.—Lvs. opposite or rarely the cauline alternate or whorled, floral lvs. always alternate: fls. in bracteate terminal or axillary racemes or spikes or sometimes solitary; calyx 4-5-parted, rarely 3-parted; corolla mostly with very short tube and spreading 4-5-lobed limb; stamens 2; ovary superior, 2-celled with axillary placentation: caps. compressed or turgid, 2-grooved, loculicidally dehiscent. (Veronica: named for St. Veronica.)

A. Foliage pinnatisect or predominantly so.

B. Plant 8-24 in. high..... 1. *V. austriaca*

BB. Plant mostly 6 in. or less, sts. usually prostrate.

C. Herbage white-pubescent..... 2. *V. pectinata*

CC. Herbage not white-pubescent.

D. Fls. white..... 3. *V. peduncularis*

DD. Fls. blue..... 4. *V. armena*

AA. Foliage entire or toothed.

B. Infl. axillary, main st. continuing as leafy shoot.

C. Pedicels filiform, four to five times longer than calyx.

D. Fls. white: lvs. coarsely toothed or pinnatisect..... 3. *V. peduncularis*

DD. Fls. blue: lvs. slightly crenate.

EE. Plant prostrate, mat-forming: lvs. to $\frac{1}{4}$ in. long..... 5. *V. filiformis*

EE. Plant erect or nearly so: lvs. mostly $\frac{1}{8}$ -1 in. long..... 10. *V. Chamædrys*

CC. Pedicels not much exceeding or shorter than calyx.

D. Calyx-lobes 5.

E. Plant tufted, sterile sts. prostrate..... 6. *V. prostrata*

EE. Plant not tufted, sterile sts. erect or ascending..... 7. *V. latifolia*

DD. Calyx-lobes 4.

E. Lvs. glabrous or nearly so..... 8. *V. Allionii*

EE. Lvs. pubescent.

F. Racemes loose and spreading, often compounded into panicles..... 10. *V. Chamædrys*

FF. Racemes spike-like, often densely so.

G. Lf. to $\frac{1}{2}$ in. long, usually white-pubescent..... 2. *V. pectinata*

GG. Lf. 1 in. long or more, not white-pubescent..... 9. *V. officinalis*

BB. Infl. terminal.

C. Plant white-woolly..... 11. *V. incana*

CC. Plant not white-woolly, although often pubescent.

D. Habit erect.

E. Pedicels three to four times longer than calyx..... 12. *V. gentianoides*

EE. Pedicels equalling or shorter than calyx.

F. Lvs. all opposite.

G. Racemes rather loose; margins of lvs. toothed to base..... 13. *V. Bachofenii*

GG. Racemes dense; margins of lvs. entire at base and tip..... 14. *V. spicata*

FF. Lvs. often in whorls of 3-4, at least on some of the sts. of a clump.

G. Racemes panicle, loose: pedicels as long as calyx..... 15. *V. spuria*

GG. Racemes solitary or few, dense: pedicels shorter than calyx..... 16. *V. longifolia*

DD. Habit prostrate.

E. Calyx-lobes 5..... 17. *V. saturioides*

EE. Calyx-lobes 4.

F. Sts. rooting, herbaceous..... 18. *V. repens*

FF. Sts. not rooting, woody at base.

G. Lvs. ovate-orbicular, clustered near top of st..... 19. *V. Nummularia*

GG. Lvs. oblong, evenly distributed..... 20. *V. fruticans*

1. *V. austriaca*, L. (*V. prenja*, G. Beck). Per. to 2 ft., with many erect or ascending sts., pubescent: lvs. sessile, pinnatisect into oblong or linear entire or incised segms.: racemes elongated, many-fl., 2-4 from upper axils; fls. deep blue, to $\frac{1}{2}$ in. across; calyx of 5 unequal lobes: caps. obcordate-ovate, about equalling calyx, glabrous or hairy. Eu., Asia Minor.

2. *V. pectinata*, L. Plant prostrate, rooting at nodes, densely white-pubescent: lvs. obovate or elliptic-lanceolate, crenate or often pinnatifid, to $\frac{1}{2}$ in. long, cuneate at base and nearly sessile: racemes elongated, many-fl., solitary in axils; fls. blue with white center, about $\frac{1}{4}$ in. across; pedicels about equalling calyx: caps. triangular-ovate, truncate or notched, exceeding calyx, pubescent. Asia Minor. Var. *rosea*, Hort., has rose fls.

3. *V. peduncularis*, Bieb. Per. with prostrate or ascending sts. 6–12 in. high; lvs. ovate or oblong, coarsely toothed or pinnatisect, very short-petioled or sessile, glabrous or hirsute; racemes loosely-fld., in upper axils; fls. white veined with pink, $\frac{1}{2}$ in. across; pedicels four to five times longer than calyx, to $\frac{1}{2}$ in. long; caps. compressed, equalling calyx, pubescent. Asia Minor.

4. *V. armena*, Boiss. & Huet. Tufted per. with many decumbent or ascending sts. to 4 in. high, hairy; lvs. sessile, pinnate into narrowly linear revolute segms. $\frac{1}{4}$ in. long; racemes few-fld., in upper axils; fls. deep blue, $\frac{1}{4}$ in. across; pedicels two to three times longer than calyx; calyx of 5 unequal lobes; caps. obcordate, much exceeding calyx, glabrous. Armenia.

5. *V. filiformis*, Smith (*V. Tournefortii*, Gmel.). Ann. or per. with filiform prostrate rooting sts., somewhat pubescent: lvs. orbicular or ovate, to $\frac{1}{2}$ in. across, obtuse, subcordate and short-petioled, slightly crenate; fls. blue, to $\frac{1}{2}$ in. across, solitary on filiform axillary pedicels four to five times longer than calyx; caps. orbicular, 2-lobed to middle, ciliate. Asia Minor.

6. *V. prostrata*, L. (*V. rupestris*, Hort.). Tufted per. with gray-hairy sts., the sterile prostrate, the flowering ascending to 8 in.: lvs. oblong to linear, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, short-petioled, crenate or dentate, margins sometimes revolute; fls. pale blue, $\frac{1}{2}$ in. across, in short dense axillary racemes; pedicels about equalling bracts and 5-parted calyx; caps. obcordate, length of calyx, glabrous. Eu.—*V. Trehanii* of hort. belongs here.

7. *V. latifolia*, L. (*V. Teucrium*, L.). Pubescent per., sterile sts. ascending or erect, to 2 ft.: lvs. sessile or the lower ones short-petioled, oblong- or linear-lanceolate, to $\frac{1}{2}$ in. long, obtusely crenate or remotely toothed; racemes 2–4 from the upper axils, elongated; fls. large, $\frac{1}{2}$ in. across, blue, rarely rose or white; pedicels equalling bracts; calyx 5-parted: caps. obcordate, pubescent, about length of calyx. Eu., Cent. Asia.

8. *V. Allionii*, Vill. Per. with prostrate rooting sts. to 1 ft. long; lvs. oval to oblong, very short-petioled, entire or serrulate, glabrous or nearly so; fls. violet, in spike-like axillary racemes; corolla four times as long as calyx; pedicels very short; caps. obcordate, about length of calyx, slightly pubescent. (Named for C. Allioni, page 38.) S. Eu.

9. *V. officinalis*, L. Pubescent prostrate per. with rooting ascending sts. 6–18 in. long; lvs. oblong, 1–2 in. long, obtuse, narrowed into petiole, serrate; racemes spike-like, dense, axillary, much longer than lvs.; fls. blue, $\frac{1}{4}$ in. across; pedicels much shorter than calyx; caps. obovate, compressed, exceeding calyx, hairy. Eu., Asia, N. Amer.

10. *V. Chamædrys*, L. (*V. pulchella*, Salisb.). GERMANDER SPEEDWELL. Per. to $1\frac{1}{2}$ ft., with sts. ascending from a creeping base: lvs. ovate, mostly $\frac{5}{8}$ – $1\frac{1}{2}$ in. long, rounded at base but sessile, crenately dentate, pubescent; racemes axillary, loose, to 6 in. long; fls. blue, to $\frac{1}{2}$ in. across; pedicels slender, usually one to three times as long as calyx; caps. obcordate, pubescent, shorter than calyx. Eu.; nat. N. S. to Ohio.

11. *V. incana*, L. (*V. candida*, Hort.). Upright or ascending white-woolly plant 1–2 ft. high, with many sterile matted branches: lvs. petioled, oblong or lanceolate, 1–3 in. long, narrowed at base, obtusely crenate; racemes solitary or many, terminal, to 6 in. long; fls. many, blue, $\frac{1}{4}$ in. across, short-pedicelled; caps. nearly orbicular, exceeding the woolly calyx. N. Asia, Russia.

12. *V. gentianoides*, Vahl. Sts. tufted, erect, simple, 6 in.–2 ft. high; lvs. thickish, glabrous or glandular-pilose, entire or small crenate, the lower forming rosettes, oblong-lanceolate, to 3 in. long, the upper lvs. remote, linear-lanceolate; racemes terminal, elongated, laxly many-fld., hairy; fls. to $\frac{1}{2}$ in. across, pale blue with darker streaks; pedicels three to four times longer than calyx; caps. orbicular, twice as long as calyx, glandular. S. E. Eu.

13. *V. Bachofenii*, Heuff. Per. with erect or ascending sts. to 2 ft.: lvs. triangular-lanceolate, to 2 in. long, subcordate at base with rather long petioles, doubly serrate, nearly glabrous or pubescent on veins beneath; racemes terminal, many, elongated, rather loose; fls. blue; pedicels about length of calyx; caps. obcordate, about equalling calyx. (Named for D. Bachofen.) Hungary.

14. *V. spicata*, L. Sts. erect or ascending, to $1\frac{1}{2}$ ft.: lvs. ovate or oblong, to 2 in. long, attenuate at base, crenate, but entire at base and tip, pubescent; racemes terminal, solitary or few, densely many-fld.; fls. blue, about $\frac{1}{2}$ in. across; pedicels shorter than bracts and calyx; caps. orbicular, exceeding calyx, pubescent. Eu., Asia. Var. *orchidea*, Fiori (*V. orchidea*, Crantz), fls. pale blue or pinkish, corolla revolute in bud. Var. *Erica*, Hort., heather-like, fls. pink. Smaller hort. forms are *corymbosa* and *nana*, and color forms *alba* and *rosea*.

15. *V. spuria*, L. (*V. amethystina*, Willd.). Sts. erect to 2 ft., densely pubescent; lvs. opposite or in whorls of 3, oblong-lanceolate, 1 in. long, acute, attenuate into short petiole, toothed; racemes in terminal panicles, rather loose; fls. blue, to $\frac{1}{2}$ in. across; pedicels as long as calyx; caps. nearly orbicular, exceeding calyx. S. E. Eu. Var. *elegans*, Voss, is more branched and pubescent.

16. *V. longifolia*, L. (*V. maritima*, L.). Sts. upright, glabrous or slightly pubescent, to 2 ft. high: lvs. opposite or ternately whorled, lanceolate or oblong, acute, short-petioled, sharply serrate entire length of lf.: racemes solitary or few, terminal, densely-fld.; fls. lilac, $\frac{1}{2}$ in. across; pedicels shorter than calyx and bracts; caps. obcordate, about length of calyx. N. Eu., N. Asia.—A useful border plant running into many vars., the most frequent of which is var. *subsessilis*, Miq. (*V. subsessilis*, Hort.), with very short-petioled lvs. and larger deep blue fls.

17. *V. satureioides*, Vis. Densely tufted per. with many creeping sts. somewhat woody at base: lvs. densely imbricated, obovate, $\frac{1}{2}$ in. long, entire or slightly toothed at tip, glabrous or nearly so: fls. blue, in terminal racemes, $\frac{1}{2}$ in. long; pedicels very short; calyx 5-parted: caps. orbicular, ciliate. Dalmatia.

18. *V. repens*, Loisel. A low delicate moss-like creeper good for ground-cover: lvs. to $\frac{1}{2}$ in. long, ovate, slightly crenate, shining green, glabrous, very short-petioled; racemes terminal, slender, few-fld.; fls. $\frac{1}{4}$ in. across, rose or nearly white, with a trace of blue, in spring; pedicels about equalling calyx and bracts: caps. broader than long, deeply notched, exceeding the sepals, ciliate-glandulose. Corsica, Spain.

19. *V. nummularia*, Pourr. Glabrous per. to 6 in., with many prostrate sts. somewhat woody at base: lvs. thickly clustered above, scale-like below, ovate-orbicular, $\frac{1}{2}$ in. long, obtuse, entire, very short-petioled: fls. blue or pink, in small terminal heads; pedicels very short: caps. orbicular, slightly notched, exceeding the sepals, ciliate. (Nummularia: old genus name meaning *coin*, because of shape of lvs.) Pyrenees.

20. *V. fruticans*, Jacq. (*V. saxatilis*, Scop.). Per. with prostrate sts. woody at base, ascending to 8 in. high: lvs. elliptic to oblong, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, entire or slightly crenate, sessile or lower very short-petioled, glabrous: fls. blue, $\frac{1}{2}$ in. across, in few-fld. terminal racemes; pedicels short: caps. ovoid, scarcely emarginate. Eu.

6. **VERONICASTRUM**, Heister. Two species of per. herbs native in E. N. Amer. and E. Asia, one often transplanted.—Lvs. in whorls of 3–5: fls. in spike-like racemes, terminal and usually several together; calyx 4-parted; corolla with tube more than twice length of 4 lobes; stamens 2, exserted: caps. ovoid, dehiscing by septical and loculicidal slits at apex. (Veronicas-trum: from *veronica* and *astrum*, star.)

V. virginicum, Farwell (*Veronica virginica*, L. *Leptandra virginica*, Nutt.). **CULVERS-ROOT.** To 7 ft.: lvs. lanceolate or oblong-lanceolate, to 6 in. long, toothed, short-petioled, long-acuminate: fls. white or pinkish, $\frac{1}{4}$ in. long, in dense racemes to 9 in. long; pedicels very short. Mass. to Man. south to Fla. and Tex.

7. **VERBASCUM**, L. **MULLEIN.** Bien. herbs of 250 and more species, rarely per. or subshrubs, native to the Medit. region, several escaped in N. Amer., a few species sometimes grown in the border.—Lvs. all alternate, entire, crenulate, dentate or pinnatifid: fls. in terminal spikes or racemes; calyx usually deeply 5-parted; corolla rotate, the tube almost none, with 5 broad slightly unequal lobes; stamens 5, the 3 posterior or all bearded: caps. globose or ovoid, septicidally dehiscent by 2 valves; seeds numerous. (Verbascum: classical Latin name.)

A. Color of fls. purple, red or white 1. *V. phoeniceum*
AA. Color of fls. yellow.

B. Fls. with pedicels as long as or longer than calyx.

c. Anthers all alike, kidney-shaped 2. *V. olympicum*

cc. Anthers of lower and longer stamens almost parallel with filament and attached to it. 3. *V. longifolium*

BB. Fls. nearly sessile.

c. Corolla 1 $\frac{1}{2}$ –2 in. across 4. *V. thapsiforme*

cc. Corolla $\frac{1}{2}$ – $\frac{3}{4}$ in. across 5. *V. Thapsus*

1. *V. phoeniceum*, L. **PURPLE MULLEIN.** To 5 ft.: lvs. glabrous above, pubescent beneath; radical lvs. petiolate, ovate or oblong-rhomboid, to 6 in. long, obtusely crenate or repand; cauline lvs. few, small, oblong or lanceolate, sessile: fls. solitary on long pedicels, about 1 in. across, borne in a simple slender nearly glabrous raceme, purple or red (white in a var.); calyx glandular, obtuse segms. elliptical; filaments purple-woolly. S. Eu., E. Asia.

2. *V. olympicum*, Boiss. To 5 ft., densely white-tomentose: lower lvs. oblong or lanceolate, entire, attenuate at base, 2 ft. and more long: fls. about 1 in. across, bright yellow, in many-fld. fascicles subtended by white-tomentose bracts, in loose racemes forming large panicles; pedicels two to three times longer than the white-tomentose calyx; filaments white-bearded, anthers kidney-shaped, all alike. Greece.

3. *V. longifolium*, Ten. To 4 ft., white- or yellowish-tomentose: lvs. numerous, densely superimposed, undulate, lower to 2 ft. long, oblong; upper oblong-lanceolate, base amplexicaul: racemes about 1 ft. long, densely-fld.; fls. golden-yellow, 1 in. across, in fascicles

of 4-10, with pedicels as long as or longer than densely tomentose calyx; anthers of lower stamens adnate-decurrent, filaments glabrous, short filaments white- or violet-bearded. S. Eu. Var. *pannosum*, Murbeck (*V. pannosum*, Vis. & Panc.), is more densely tomentose and all the filaments bearded.

4. *V. thapsiforme*, Schrad. (*V. densiflorum*, Vis.). To 5 ft., densely yellowish-tomentose: lower lvs. oblong-elliptic or elliptic-lanceolate, attenuate at base into petiole, to 16 in. long, coarsely crenate; cauline lvs. narrowly decurrent: fls. yellow, nearly sessile, $1\frac{1}{2}$ -2 in. across, in usually 4-fl. fascicles forming a dense spike; corolla flat; calyx with lanceolate tomentose segms.; filaments of 2 anterior stamens glabrous with adnate long-decurrent anthers, posterior stamens densely bearded. Eu.

5. *V. Thapsus*, L. COMMON MULLEIN. To 7 ft., densely yellowish-tomentose: lower lvs. oblong, to 1 ft. long, short-petioled, crenate or nearly entire; cauline lvs. long-decurrent: fls. yellow, sessile, $\frac{1}{2}$ - $\frac{3}{4}$ in. across, in 1-7-fl. fascicles forming long dense spikes; corolla concave at throat; calyx-segms. lanceolate, densely tomentose; filaments of 2 anterior stamens glabrous or slightly hairy with adnate short-decurrent anthers, posterior stamens densely bearded. (*Thapsus*: from the Greek *yellow*.) Eu., Asia; nat. in N. Amer.

8. **PENSTEMON**, Mitch. About 250 species of per. herbs or shrubs, native in N. Amer., Mex., and 1 species in N. E. Asia, furnishing many ornamental subjects.—Sparingly branched: lvs. opposite or whorled, lower ones petioled, upper sessile: fls. in terminal racemes or panicles, showy; calyx 5-parted, segms. imbricated; corollatube elongated, usually dilated at throat, more or less bilabiate, upper lip 2-lobed, lower lip 3-lobed; fertile stamens 4, the fifth sterile stamen about as long as others, naked or bearded; style filiform, stigma capitate: caps. septicidally dehiscent; seeds numerous, wingless. (Penste-mon: Greek *five stamens*, the fifth stamen being present, although sterile; often written *Pentstemon*.)

A. Margins of lvs. entire.

B. Fls. scarlet.

c. Lower lip bearded. 1. *P. barbatus*

cc. Lower lip not bearded.

D. Length of corolla $1\frac{1}{4}$ in. or less.

E. Sterile stamen glabrous.

F. Lvs. linear. 2. *P. Torreyi*

FF. Lvs. ovate-lanceolate. 3. *P. centranthifolius*

EE. Sterile stamen bearded. 4. *P. corymbosus*

DD. Length of corolla 2 in. 5. *P. Hartwegii*

BB. Fls. blue, purple, white or yellow.

c. Sts. erect, 1 ft. or more high.

D. Color of fls. yellow.

E. Length of lvs. $\frac{1}{2}$ in. 6. *P. antirrhinoides*

EE. Length of lvs. 1-2 in. 7. *P. confertus*

DD. Color of fls. blue, purple, lilac or white.

E. Infl. glandular-pubescent.

F. Sterile stamen glabrous. 8. *P. Roezlii*

FF. Sterile stamen bearded.

G. Corolla bearded within.

H. Length of fls. 1 in. 33. *P. fruticosus*

HH. Length of fls. about $\frac{1}{2}$ in. 9. *P. humilis*

GG. Corolla not bearded within. 10. *P. tubiflorus*

EE. Infl. glabrous.

F. Calyx-lobes erose, broadly scarious-margined.

G. Corolla bearded within. 11. *P. procerus*

GG. Corolla not bearded within.

H. Radical lvs. small or none: infl. short and dense. 12. *P. alpinus*

HH. Radical lvs. oblanceolate: infl. long and narrow.

I. Sterile stamen bearded at tip. 13. *P. glaber*

II. Sterile stamen glabrous. 15. *P. speciosus*

FF. Calyx-lobes not erose, margins, if scarious, narrow.

G. Sterile stamen glabrous.

H. Length of fls. to $\frac{3}{4}$ in.: infl. secund. 16. *P. unilateralis*

HH. Length of fls. $1\frac{1}{4}$ - $1\frac{1}{2}$ in.: infl. not secund.

I. Herbage green. 17. *P. heterophyllus*

II. Herbage glaucous. 18. *P. azureus*

GG. Sterile stamen bearded.

H. Lvs. ovate.

I. Length of fls. $\frac{3}{4}$ -1 in.

J. Racemes interrupted. 19. *P. acuminatus*

JJ. Racemes dense and compact. 14. *P. cyananthus*

II. Length of fls. $1\frac{1}{2}$ -2 in. 20. *P. grandiflorus*

HH. Lvs. linear or lanceolate.

I. Racemes interrupted. 21. *P. secundiflorus*

II. Racemes dense and compact. 22. *P. angustifolius*

cc. Sts. prostrate, 2-8 in. high.

- D. Lvs. ovate.....32. *P. Davidsonii*
DD. Lvs. linear-lanceolate.....28. *P. Crandallii*
AA. Margins of lvs. serrate.
B. Color of fls. red.
c. Habit climbing.....23. *P. cordifolius*
cc. Habit not climbing.
d. Infl. open and leafy; lvs. deeply lobed or pinnatifid.....24. *P. Richardsonii*
DD. Infl. compact; lvs. shallowly toothed.
E. Anthers densely woolly.
F. Lvs. $\frac{1}{4}$ – $\frac{1}{2}$ in. long.....35. *P. rupicola*
FF. Lvs. $\frac{3}{4}$ – $1\frac{1}{4}$ in. long.....36. *P. Newberryi*
EE. Anthers not woolly.....4. *P. corymbosus*
BB. Color of fls. blue, purple or white.
c. Infl. glabrous.

E. Anthers densely woolly.
F. Length of lvs. $\frac{1}{2}$ in. or less.....31. *P. Menziesii*
FF. Length of lvs. $\frac{3}{4}$ –1 in.
g. Lvs. acute.....33. *P. fruticosus*
GG. Lvs. obtuse.....34. *P. Cardwellii*
EE. Anthers not densely woolly.
F. Fls. very broad, to 1 in. across at mouth.....37. *P. Cobæa*
FF. Fls. not more than $\frac{1}{2}$ in. across.
g. Sts. glabrous below the infl.
H. Lvs. very long-acuminate.....38. *P. campanulatus*
HH. Lvs. acute or short-acuminate.
I. Calyx-lobes linear-subulate, to $\frac{2}{3}$ in. long.....39. *P. calycosus*
II. Calyx-lobes lanceolate, less than $\frac{2}{3}$ in. long.
J. Corolla bearded within.
K. St.-lvs. ovate-lanceolate.....40. *P. Rattanii*
KK. St.-lvs. linear-lanceolate.....41. *P. gracilis*
JJ. Corolla not bearded within.
K. Corolla-tube gradually enlarged, purplish.....42. *P. lævigatus*
KK. Corolla-tube abruptly enlarged, white or pinkish.....43. *P. Digitalis*
GG. Sts. pubescent below the infl.
H. Throat bearded.
I. St.-lvs. lanceolate.....44. *P. hirsutus*
II. St.-lvs. ovate.
J. Corolla abruptly constricted at base; color pink-purple.....45. *P. Smallii*
JJ. Corolla not abruptly constricted; color blue-purple.....46. *P. ovatus*
HH. Throat not bearded.
I. Corolla white.....47. *P. albidus*
II. Corolla blue or purple.....48. *P. diffusus*
1. *P. barbatus*, Nutt. (*Chelone barbata*, Cav.). To 6 ft., glabrous; lvs. 2–6 in. long, lower oblong or ovate, upper lanceolate or linear, entire; infl. long and open; fls. about 1 in. long, red, strongly 2-lipped, the lower lip bearded with yellow hairs; sterile stamen glabrous. Mts., Utah to Mex.
2. *P. Torreyi*, Benth. (*P. barbatus* var. *Torreyi*, Gray). Differs from *P. barbatus* in its larger scarlet fls. and the lower lip not being bearded. (For John Torrey, page 53.) Utah to Mex.
3. *P. centranthifolius*, Benth. SCARLET BUGLER. From 1–3 ft., glaucous; lvs. thick, entire, from ovate- to oblong-lanceolate, $1\frac{1}{2}$ – $2\frac{1}{2}$ in. long, the upper with subcordate clasping base; infl. long and narrow; fls. about 1 in. long, scarlet, tubular, the lobes very short; sterile stamen glabrous. Calif. to Ariz.
4. *P. corymbosus*, Benth. Shrub to 16 in., tufted; lvs. oblong or obovate, $\frac{1}{4}$ – $1\frac{1}{4}$ in. long, toothed or entire; infl. short, glandular-pubescent; fls. scarlet, $1-1\frac{1}{4}$ in. long; sterile stamen bearded. Calif.
5. *P. Hartwegii*, Benth. (*P. gentianoides*, Lindl.). From 3–4 ft., glabrous except infl.: lvs. lanceolate to ovate-lanceolate, 2–4 in. long, entire; infl. long and open; fls. to 2 in. long, scarlet, slightly curved; sterile stamen glabrous. (Hartweg, page 44.) Cool regions in Mex.—*P. gloxinoides*, Hort., is a race of hybrids between *P. Hartwegii* and *P. Cobæa*, many colors.
6. *P. antirrhinoides*, Benth. Shrub to 6 ft., branched and leafy, slightly pubescent; lvs. very small, to $\frac{1}{2}$ in. long, linear or oblong, entire; infl. a leafy panicle; sepals broadly ovate; corolla very broad, $\frac{3}{4}$ in. long, ventricose, yellow; sterile stamen densely bearded on one side. S. Calif.
7. *P. confertus*, Dougl. To 2 ft., glabrous; lvs. oblong or lanceolate, 2 in. and more long, entire; infl. interrupted, of whorled clusters; fls. pale yellow, about $\frac{1}{2}$ in. long, lower lip yellow-hairy within; sterile stamen bearded. Alta. to Calif.

8. *P. Roezlii*, Regel (*P. latus* var. *Roezlii*, Jepson). To 1 ft., sts. erect or ascending: lvs. linear to oblanceolate, 1-3 in. long, entire: infl. an open glandular-pubescent panicle; fls. pale blue or violet, $\frac{1}{2}$ - $\frac{3}{4}$ in. long; sterile stamen glabrous. (Named for B. Roetzl, page 50.) Mts., Ore. to Calif.

9. *P. humilis*, Nutt. To 1 ft., pubescent: lvs. ovate to lanceolate, about 1 in. long, entire: infl. interrupted, glandular-pubescent; fls. deep blue, to $\frac{1}{2}$ in. long, throat bearded within; sterile stamen bearded at apex. Wyo., Ida., Utah.

10. *P. tubiflorus*, Nutt. To 3 ft.: lvs. ovate to lanceolate, to 4 in. long, entire: infl. interrupted, glandular-pubescent; fls. white or purplish, $\frac{3}{4}$ in. long; sterile stamen bearded. Mo. to Ark. and Okla.

11. *P. procerus*, Dougl. To 1 ft., glabrous: lvs. oblanceolate, to 3 in. long: infl. compact; fls. purplish-blue, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, bearded within; calyx-lobes erose and scarious-margined; sterile stamen bearded. Sask. to Calif.

12. *P. alpinus*, Torr. (*P. glaber* var. *alpinus*, Gray). Usually not more than 1 ft. high: st.-lvs. lanceolate, 2-4 in. long, entire: infl. short and dense; fls. bluish-purple, 1 in. long; calyx-lobes erose, with broad scarious margins; sterile stamen yellow-bearded at apex. Rocky Mts.

13. *P. glaber*, Pursh. From 1-2 ft., glabrous and somewhat glaucous: lvs. oblanceolate to lanceolate, to 6 in. long, entire: infl. densely many-fl'd., long and narrow; fls. 1 in. or more long, blue or purple; calyx-lobes erose, with broad scarious margins; sterile stamen bearded at tip. N. D. to Wyo.

14. *P. cyananthus*, Hook. (*P. glaber* var. *cyananthus*, Gray). From 1-3 ft., glabrous and glaucous: st.-lvs. ovate or subcordate, $\frac{3}{4}$ -3 in. wide: infl. dense; fls. about 1 in. long, bright blue; sterile stamen bearded. Mts., Utah, Ida., Wyo.

15. *P. speciosus*, Dougl. To 2 ft., glabrous: lvs. oblanceolate to linear-lanceolate, to 4 in. long, entire: infl. long and narrow; fls. bluish-purple, 1 in. long, ventricose; calyx-lobes erose with broad scarious margins; sterile stamen glabrous. Wash. to Calif.

16. *P. unilateralis*, Rydb. To 2 ft., glabrous: lvs. oblanceolate to linear-lanceolate, to 4 in. long, entire: infl. narrow and secund; fls. blue, $\frac{3}{4}$ in. long, abruptly ventricose; calyx-lobes with slightly scarious entire margins; sterile stamen glabrous. Wyo. to New Mex.

17. *P. heterophyllus*, Lindl. To 5 ft., base woody, glabrous: lvs. lanceolate or linear, to 2 $\frac{1}{2}$ in. long and $\frac{1}{2}$ in. or less wide, entire: infl. loose and open, narrow; fls. 1 $\frac{1}{4}$ -1 $\frac{1}{2}$ in. long, purple or pinkish-blue, slender at base but dilated above; sterile stamen glabrous. Calif.

18. *P. azureus*, Benth. (*P. heterophyllus* var. *azureus*, Jepson). Differs from *P. heterophyllus* in being somewhat pubescent and glaucous and with slightly broader lvs. Calif.

19. *P. acuminatus*, Dougl. To 1 $\frac{1}{2}$ ft., glabrous and glaucous: lvs. thick and leathery, entire, lower oblanceolate, to 3 in. long, upper ovate-cordate: infl. interrupted; fls. blue, $\frac{3}{4}$ in. long, funnelform; sterile stamen densely bearded. Wash. to Tex.

20. *P. grandiflorus*, Nutt. From 2-6 ft., glabrous: lvs. obovate to broadly ovate, to 2 $\frac{1}{2}$ in. long, obtuse, entire: infl. loose; fls. about 2 in. long, lavender-blue, tube abruptly dilated above calyx; sterile stamen minutely pubescent at tip. Prairies, Ill. to Wyo.

21. *P. secundiflorus*, Benth. To 2 ft., glabrous and glaucous: lvs. oblanceolate to lanceolate, to 3 in. long, entire: infl. interrupted, secund; fls. bluish-purple, $\frac{3}{4}$ in. long, funnelform; sterile stamen densely bearded. Wyo. to New Mex.

22. *P. angustifolius*, Pursh (*P. cæruleus*, Nutt.). To 1 ft., glabrous and glaucous: lvs. linear or linear-lanceolate, to 4 in. long, entire: infl. dense; fls. blue, lilac or white, to $\frac{3}{4}$ in. long, funnelform; calyx-lobes lanceolate, with narrow scarious margins; sterile stamen bearded. Plains, S. D. to New Mex.

23. *P. cordifolius*, Benth. Somewhat pubescent very leafy plant half climbing over shrubs, to 10 ft.: lvs. ovate, $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long, truncate or subcordate at base, serrate: infl. short and leafy, glandular-pubescent; fls. 1 $\frac{1}{4}$ -1 $\frac{1}{2}$ in. long, scarlet, tubular with short lobes; sterile stamen bearded. S. Calif.

24. *P. Richardsonii*, Dougl. To 2 ft., loosely branched: lvs. ovate to lanceolate, 1-2 in. long, deeply toothed or pinnatifid: infl. open and leafy, glandular-pubescent; fls. red, 1-1 $\frac{1}{4}$ in. long, lower lip bearded within; sterile stamen exerted, bearded at apex. (Named for J. Richardson, page 50.) B. C. to Ida.

25. *P. deustus*, Dougl. To 1 ft., woody at base, nearly glabrous: lvs. ovate to oblanceolate, $\frac{1}{2}$ -1 $\frac{1}{4}$ in. long, toothed: infl. of small clusters in upper axils; fls. whitish, $\frac{1}{4}$ - $\frac{1}{2}$ in. long; sterile stamen usually bearded. B. C. to Calif.

26. *P. spectabilis*, Thurber. From 2-6 ft., glabrous and glaucous: lvs. ovate to oblanceolate, 3-4 in. long, the upper ones connate at base, sharply dentate: infl. a narrow panicle 1 ft. or more long; fls. 1 in. or more long, rose-purple or lilac, the narrow part of tube about twice length of calyx, upper part dilated; sterile stamen glabrous. New Mex. to S. Calif.

27. *P. venustus*, Dougl. To 2 ft., glabrous and glaucous: lvs. lanceolate or oblanceolate, 1-2 in. long, toothed: infl. narrow; fls. blue or light purple, 1 in. long; calyx with erose scarious margins; corolla with ciliate lobes and lower lip often hairy within; sterile stamen bearded, anthers hairy. Wash., Ore., Ida.

28. *P. Crandallii*, A. Nels. Slightly glandular-pubescent, sts. densely tufted, prostrate or ascending, to 8 in. high: lvs. linear-oblanceolate, to 1 in. long, entire: fls. solitary or in small clusters, blue, $\frac{3}{4}$ -1 in. long; sterile stamen bearded. (Named for C. S. Crandall, 1852-1929.) Mts., Colo.

29. *P. Barrettae*, Gray. To 1 ft., glabrous and glaucous: lvs. ovate to lanceolate, to 3 in. long, toothed: infl. narrow; fls. lilac-purple, 1-1½ in. long, lower lip bearded within; sterile stamen slightly hairy, anthers densely woolly. (Named for the original collector, Mrs. Barrett.) Ore.

30. *P. Scouleri*, Dougl. Shrub to 1½ ft.: lvs. lanceolate, to 2 in. long, toothed: infl. few-fld., slightly glandular-pubescent; fls. lilac-purple, to 2 in. long; sterile stamen glabrous, anthers densely woolly. (Named for John Scouler, 1804-1871, who collected in N. W. U. S. in 1825.) Mts., B. C. to Ida.

31. *P. Menziesii*, Hook. To 6 in., densely tufted: lvs. thick, obovate, $\frac{1}{4}$ -½ in. long, toothed: infl. glandular-pubescent; fls. purple, 1 in. long; sterile stamen bearded, anthers densely woolly. (Named for Archibald Menzies, page 399.) Alta. to B. C. and Wash.

32. *P. Davidsonii*, Greene (*P. Menziesii* var. *Davidsonii*, Piper). Prostrate, with matted sts. to 3 in. high: lvs. ovate, ½ in. long, entire: infl. few-fld., glandular-pubescent; fls. lilac-purple, 1-1½ in. long; sterile stamen bearded. (Named for its collector, Dr. Geo. Davidson.) B. C. to Calif.

33. *P. fruticosus*, Green (*Gerardia fruticosa*, Pursh). Shrubby, with erect sts. 8 in.-3 ft. high: lvs. oblanceolate, $\frac{3}{4}$ -1 in. long, serrulate or entire: infl. simple, glandular-pubescent; fls. purplish-blue, 1 in. long, throat bearded within; sterile stamen bearded at apex. Alta. to Ore.

34. *P. Cardwellii*, Howell (*P. fruticosus* var. *Cardwellii*, Piper). To 10 in., loosely tufted: lvs. thick, oblong-elliptic to oval, 1-1½ in. long, obtuse, toothed: infl. slightly glandular-pubescent; fls. purple, 1¼ in. long, bearded within; sterile stamen bearded, anthers densely woolly. Wash., Ore.

35. *P. rupicola*, Howell. Much-branched decumbent pubescent shrub to 4 in. high: lvs. thick, ovate or orbicular, $\frac{1}{4}$ -½ in. long, toothed, glaucous: infl. of few fls., glandular-pubescent; fls. bright rose-crimson, 1-1½ in. long, ventricose; sterile stamen usually bearded, shorter than fertile ones, anthers densely woolly. Wash., Ore.

36. *P. Newberryi*, Gray. MOUNTAIN PRIDE. To 20 in., woody at base: lvs. leathery, ovate or orbicular, $\frac{3}{4}$ -1¼ in. long, toothed: infl. short, glandular-pubescent; fls. red, about 1 in. long; sterile stamen bearded at apex, anthers densely woolly and exerted. (Named for Dr. J. S. Newberry, 1822-1892, collector on railroad surveys.) Mts., Calif.

37. *P. Cobæa*, Nutt. To 2 ft., stout: lvs. oblong to ovate, 3-5 in. long, dentate: infl. open, glandular-pubescent; fls. about 2 in. long, purple, tube abruptly dilated above calyx, the limb scarcely 2-lipped; sterile stamen bearded. (Cobæa: fls. cobæa-like.) Mo. and Kans. to Tex.

38. *P. campanulatus*, Willd. (*Gerardia hybrida*, Hort.). To 2 ft., glabrous below infl.: lvs. lanceolate, long-acuminate, to 4 in. long, strongly serrate: infl. long and narrow, slightly glandular-pubescent; fls. about 1 in. long, rose-purple or violet, sometimes white, dilated at middle; sterile stamen bearded. Mex., Guatemala.

39. *P. calycosus*, Small. From 1-4 ft. high, sts. glabrous below the sparingly pubescent infl.: lvs. spatulate to lanceolate, to 6 in. long, sharply serrate or nearly entire: fls. about 1 in. long, purple; corolla-tube abruptly dilated at middle; calyx-lobes linear-subulate, becoming fully ½ in. long; sterile stamen bearded. Ind. to Ala.

40. *P. Rattanii*, Gray. Sts. 1-2 ft., glabrous: lower lvs. lanceolate, to 6 in. long, petioled, toothed, st.-lvs. ovate-lanceolate and clasping, to 2½ in. long: infl. glandular-pubescent; fls. lavender, 1 in. long, tube abruptly expanded, lower lip bearded within; sterile stamen bearded, exerted. (Named for Volney Rattan, Calif., botanist of the last century.) Ore., Calif.

41. *P. gracilis*, Nutt. To 1½ ft., sts. glabrous or nearly so: lower lvs. oblanceolate, to 3 in. long, toothed or entire, st.-lvs. linear-lanceolate, toothed: infl. glandular-pubescent, open; fls. lilac or whitish, $\frac{3}{4}$ -1 in. long, slightly bearded within, tube gradually enlarged; sterile stamen bearded. Man. to Sask. and New Mex.

42. *P. lævigatus*, Soland. (*Chelone Penstemon*, L.). To 3 ft., sts. glabrous: lvs. oblong or lanceolate, to 6 in. long, toothed: infl. open, many-fld., glandular-pubescent; fls. purplish, $\frac{3}{4}$ -1 in. long, tube gradually enlarged; sterile stamen bearded. Pa. to Fla. and Ala.

43. *P. Digitalis*, Nutt. (*P. lævigatus* var. *Digitalis*, Gray). To 5 ft., sts. glabrous: lvs. oblong, lanceolate or ovate-lanceolate, to 7 in. long, sharply toothed: infl. open, many-fld., glandular-pubescent; fls. white or pinkish, about 1 in. long, tube abruptly dilated at middle; sterile stamen bearded. (Digitalis: a genus of Scrophulariaceæ.) Me. to S. D. and Tex.

44. *P. hirsutus*, Willd. (*P. pubescens*, Soland. *Chelone hirsuta*, L.). To 3 ft., usually viscid-pubescent: lvs. oblong to lanceolate, to $4\frac{1}{2}$ in. long, toothed: infl. loose and open; fls. purplish or violet, about 1 in. long, densely bearded in throat; sterile stamen densely bearded above middle. Me. to Tenn. and Wis.

45. *P. Smallii*, Heller. To 4 ft., sts. puberulent: lvs. lanceolate to ovate-lanceolate, 3-6 in. long, sharply toothed: infl. loose and panicle-like, glandular-pubescent; fls. pink-purple striped with white within, $1-1\frac{1}{2}$ in. long, tube abruptly dilated near middle, with long yellow hairs in throat; sterile stamen bearded to base. (Named after J. K. Small, page 51.) N. C., Tenn.

46. *P. ovatus*, Dougl. To 4 ft., sts. pubescent: lvs. broad-ovate, 2-3 in. long, toothed: infl. loose, glandular-pubescent; fls. less than 1 in. long, blue changing to purple; lower lip bearded in throat; sterile stamen bearded. B. C. to Ore. and Mont.

47. *P. albidus*, Nutt. To 1 ft., glandular-pubescent: lvs. oblong or lanceolate, to $2\frac{1}{2}$ in. long, toothed: infl. narrow, racemose; fls. white, sometimes with purple lines, $\frac{3}{4}$ in. long, funnelform; sterile stamen slightly bearded. Man to Tex.

48. *P. diffusus*, Dougl. To 2 ft., diffuse, sts. somewhat puberulent: lvs. ovate or lanceolate, upper subcordate, 2 in. or more long, unevenly and deeply toothed: infl. leafy, pedicels very short, glandular-pubescent; fls. funnelform, $\frac{3}{4}$ in. long, blue or purple; sterile stamen bearded above. B. C. to Ore.

9. **CHELONE**, L. **TURTLE-HEAD**. About 8 species of per. herbs native in N. Amer., grown in the hardy border.—Lvs. opposite, serrate: fls. sessile in dense axillary or terminal spikes; calyx 5-parted; corolla with elongated ventricose tube and 2-lipped limb, the upper lip concave and notched, the lower 3-lobed; stamens 4, the fifth sterile stamen shorter than others, filaments woolly; stigma capitate: caps. ovoid, septically dehiscent; seeds winged. (Chelone: Greek *tortoise*; the corolla resembling a turtle's head.)

A. Lvs. ovate, long-petioled: bracts ciliate.....1. *C. Lyoni*
 AA. Lvs. narrow- to broad-lanceolate: bracts not ciliate.....2. *C. glabra*

1. *C. Lyoni*, Pursh. To 3 ft.: lvs. ovate, 3-7 in. long, acuminate, long-petioled: fls. rose-purple, about 1 in. long, in July-Sept.; anterior lip yellow-bearded; bracts ciliate and puberulent. (John Lyon, page 772.) Mts., N. C., S. C., Tenn.

2. *C. glabra*, L. To 3 ft.: lvs. narrow- to broad-lanceolate, $2\frac{1}{2}$ -6 in. long, acuminate, short-petioled: fls. white or rose-tinged, about 1 in. long, in July-Sept.; anterior lip white-bearded; bracts glabrous, not ciliate. Wet grounds, Newf. to Ga. and Minn.

10. **HEBENSTRETIA**, L. Ann. herbs, subshrubs, or shrubs, of about 30 species mostly from S. Afr., one sometimes grown in the fl.-garden.—Lvs. alternate or lower ones opposite, entire or dentate: fls. sessile in dense terminal spikes, yellow or white; calyx spathe-like, split down the front; corolla with slender tube, deeply cut in front, with 4-lobed posterior limb; stamens 4, inserted on corolla-tube; style entire: fr. indehiscent. (Hebenstretia: after John Ernst Hebenstreit, 1703-1757, professor of medicine in the Univ. of Leipzig.)

H. comosa, Hochst. To 4 ft.: lvs. numerous, lanceolate, $\frac{1}{2}$ -2 in. long, remotely sharp-toothed, glabrous: fls. yellow or white with orange-red blotch on limb, very fragrant at night, about $\frac{1}{2}$ in. long, in dense slender long-tapering spikes 2-10 in. long. Natal.

11. **CELSIA**, L. About 40 species of bien. or per. herbs, mostly from the Medit. region and Asia, 1 from S. Afr.—Differs from *Verbascum* only in having 4 stamens instead of 5. (Celsia: Olaus Celsius, 1670-1756, Swedish theologian and naturalist, teacher of Linnæus.)

A. Fls. almost sessile.....1. *C. cretica*
 AA. Fls. long-pedicelled.....2. *C. Arcturus*

1. *C. cretica*, L. f. **CRETAN MULEIN**. To 6 ft., hairy: lvs. ovate or oblong, dentate, the lower petioled, lyrate-pinnatifid or undivided: bracts lanceolate, serrate or entire, longer than calyx: fls. in lax racemes, almost sessile, yellow marked with purple; shorter filaments violet-bearded, longer glabrous: caps. glabrous, shorter than calyx. Medit. region.

2. *C. Arcturus*, Jacq. **CRETAN BEARS-TAIL**. Differs from *C. cretica* in the long-pedicelled fls., the triangular denticulate bracts being much shorter than the pedicels, the filaments all violet-bearded, and the caps. almost three times length of calyx. (*Arcturus*: bear and tail, a genus of Scrophulariaceæ.) Crete and Asia Minor.

12. **REHMANNIA**, Libosch. (*Sparmannia*, Buc'hoz, not L.f.). Five or more species of per. sticky-hairy herbs from China and Japan, grown in a cool greenhouse or out-of-doors in the S.—Sts. branching from the base, in cult. tall and few-lvd.: lvs. alternate, obovate or oblong, coarsely toothed: fls. large, borne in the axils of the lvs. or in terminal racemes, short-pedicelled; calyx ovoid, campanulate, 5-cleft at top; corolla slightly incurved, tube ventricose, limb oblique, lobes spreading, the rear or inner one 2-cleft, the front lobe 3-cleft; stamens 4, included: caps. broad, almost inclosed by calyx, loculicidally dehiscent; seeds numerous. (Rehmannia: Jos. Rehmann, 1779–1831, physician in Leningrad.)

R. angulata, Hemsl. From 1–3 ft. high: lvs. either having many marginal teeth, or the few lobes or large teeth being again toothed: bracts with very broad and rather abruptly cuneate bases wider than any other part of blade: corolla about 2 in. long, red with band of scarlet at margin of upper lip and orange dots inside lower lip. China.—Garden forms are var. *tigrina*, Hort., with fls. marked, and var. *tricolor*, Hort., with fls. at first bright purple, later almost violet-rose, upper lip shaded with vermilion and throat whitish, spotted with purple.

13. **PEDICULARIS**, L. WOOD-BETONY. LOUSEWORT. A large genus in the northern hemisphere, about 350 herbaceous species, suitable for the rock-garden.—Lvs. alternate, opposite or rarely whorled, usually pinnatisect: fls. in terminal bracted spikes; calyx tubular, 2–5-toothed; corolla with cylindrical tube, 2-lipped, the lower lip 3-lobed; stamens 4, included: caps. oblique, loculicidally dehiscent; seeds numerous. (*Pedicularis*: from Latin for *louse*, supposed to cause lice on stock feeding on these plants.)

P. canadensis, L. Pubescent per. 1–1½ ft. high: lvs. mostly alternate, oblong-lanceolate, to 5 in. long, divided nearly to midrib into toothed lobes: fls. yellow or reddish, rarely white, ¾ in. long, in spring, borne in pubescent spikes becoming 8 in. long in fr.: caps. twice as long as calyx. Que. to Fla. and Mex.

14. **ERINUS**, L. One alpine species native in the mts. of W. and Cent. Eu.—Root-lvs. crowded, st.-lvs. alternate: fls. in simple racemes; corolla-lobes 5; calyx 5-parted nearly to base; stamens 4, included; style very short, 2-lobed at apex: caps. ovate, dehiscent; seeds numerous. (*Eri-nus*: Greek name used by Dioscorides.)

E. alpinus, L. Tufted per. to 4 in.: lvs. spatulate, ¼–½ in. long, toothed: fls. purple, ½ in. across, in racemes 1–2½ in. long, in spring. Var. *albus*, Hort., fls. white. Vars. *carmineus* and *roseus*, Hort., fls. rose.

15. **LEUCOPHYLLUM**, Humb. & Bonpl. Pubescent shrubs of about a dozen species from Tex. to Mex., one popular as a hedge plant in its region.—Lvs. alternate, entire: fls. solitary in the axils; calyx 5-parted nearly to base; corolla funnel-form-campanulate with 5 lobes; stamens 4, included: caps. 2-valved; seeds numerous. (*Leucophyl-lum*: Greek for *white leaf*.)

L. frutescens, Johnston (*Teramia frutescens*, Berl. *L. texanum*, Benth.). CENIZO. White-tomentose, 4–8 ft. high: lvs. obovate, ½–1 in. long, obtuse, narrowed at base, nearly sessile: fls. violet-purple, 1 in. long and across, hairy within.

16. **DIGITALIS**, L. FOXGLOVE. About 25 species from Eu. and W. and Cent. Asia, useful for the herbaceous border.—Herbs, rarely woody at base, glabrous, tomentose or villous, usually simple: lvs. alternate, lower often crowded and elongated, entire or dentate: fls. in long terminal racemes often one-sided, showy, purple, yellowish, or white; calyx 5-parted; corolla declined, tube inflated or campanulate, often constricted above the ovary, the limb erect-spreading and somewhat 2-lipped, the upper lip shorter than lower; stamens 4, usually included: caps. ovate, septicidally dehiscent; seeds numerous. (*Digitalis*: Latin, finger of a glove, referring to the shape of the fls.)

A. Middle lobe of lower lip markedly longer than others and equalling or exceeding corolla-tube.

B. Rachis of racemes glandular-pubescent.

C. Bracts much longer than calyx: racemes dense.....1. *D. lanata*

CC. Bracts about length of calyx: racemes loose.....2. *D. orientalis*

BB. Rachis of racemes glabrous.

- c. Lobes of calyx ovate, obtuse, scarious-margined.....3. *D. ferruginea*
 cc. Lobes of calyx lanceolate, acute, not scarious-margined.....4. *D. lævigata*
 AA. Middle lobe of lower lip not markedly longer than others and much shorter than corolla-tube.
 B. Under surface of lvs. and pedicels glabrous.....5. *D. lutea*
 BB. Under surface of lvs. and pedicels hairy.
 c. Lobes of calyx linear.....6. *D. grandiflora*
 cc. Lobes of calyx ovate.....7. *D. purpurea*

1. *D. lanata*, Ehrh. GRECIAN FOXGLOVE. Per. or bien., 2-3 ft., sts. strict and unbranched, white-pubescent above; lvs. many, long-lanceolate, somewhat ciliate or smooth, sessile; racemes closely many-fld., downy with many long soft hairs; calyx-lobes linear, downy, shorter than corolla; corolla about 1 in. long, half of which is an urn-shaped closely brown-reticulated body with very short upper and lateral teeth; middle lower lobe about as long as body and projecting, pointed, nearly white with fine veins; bracts much longer than calyx, equalling or exceeding corolla. Danube region and Greece.

2. *D. orientalis*, Lam. Per. to 3 ft., sts. white-glandular-pubescent above; lvs. lanceolate, glabrous, sessile; racemes loose and interrupted; calyx-lobes elliptic, obtuse, downy; corolla 1 in. long, white finely striped with red except the long lower lip; bracts about length of calyx. Levant.

3. *D. ferruginea*, L. RUSTY FOXGLOVE. Bien. or per. to 6 ft., with simple very leafy sts.: lvs. long-lanceolate, deeply veined, sessile, glabrous or ciliate; racemes long and dense; calyx-lobes ovate, obtuse, glabrous, scarious-margined; corolla $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long, yellowish marked with rusty-red, pubescent, middle lobe longer than others. S. Eu., W. Asia.

4. *D. lævigata*, Waldst. & Kit. Per. 2-3 ft. high, glabrous; lvs. obovate- to linear-lanceolate, sessile; racemes long and loose; calyx-lobes lanceolate, acute; corolla $\frac{3}{4}$ -1 $\frac{1}{4}$ in. long, yellow marked with brown-purple, middle lobe as long as corolla-tube. S. Eu.

5. *D. lutea*, L. STRAW FOXGLOVE. Per. or bien. 2-3 ft. high, glabrous; lvs. oblong or lanceolate; racemes many-fld., one-sided; calyx-lobes lanceolate, acute; corolla $\frac{3}{4}$ in. long, yellow to white, upper lip 2-parted. Eu.

6. *D. grandiflora*, Mill. (*D. ambigua*, Murr.). YELLOW FOXGLOVE. Per. or bien. 2-3 ft. high, hairy; lvs. ovate-lanceolate, toothed, sessile or clasping; fls. large, 2 in. long, yellowish marked with brown; calyx-lobes linear; middle lobe of lower lip shorter than the corolla-tube; lower bracts about as long as fl. Eu., W. Asia.

7. *D. purpurea*, L. COMMON FOXGLOVE. Bien., sometimes per., 2-4 ft. high; lvs. rugose, somewhat downy, the radical ones long-stalked and ovate to ovate-lanceolate, the st.-lvs. short-stalked or sessile, becoming small toward top of st.: fls. large, 2-3 in. long, pendulous, borne in a one-sided raceme 1-2 ft. long, purple more or less spotted, lobes ciliate; calyx-lobes broadly ovate: caps. ovoid, exceeding calyx. W. Eu.—Variable, running into many garden forms as: var. *gloxiniæflora*, Vilm. (*D. gloxinioides*, Carr.), of more robust habit, having longer racemes and more wide open fls. strongly spotted; var. *campanulata*, Vilm., with upper fls. united into a bell-shaped large bloom; var. *alba*, Hort., fls. white; var. *maculata*, Voss, fls. spotted; var. *monstrosa*, Hort., a double peloric form. *D. Isabellina*, Hort., has yellow fls. *D. Lutzii*, Hort., represents a hybrid group with fls. in shades of crimson.

17. **ISOPLEXIS**, Lindl. Two species of subshrubs from the Canary Isls., grown in the open in Calif.—Lvs. alternate; fls. in dense terminal racemes, yellow; calyx 5-parted; corolla incurved, tube ventricose, upper lip as long as or longer than under lip; stamens 4, shorter than corolla and slightly exerted; style 2-lobed at top: caps. ovate, septicidally dehiscent; seeds numerous. (Isoplexis-is: Greek *equal* and *cut*, referring to the lips of the corolla being equal.)

I. *canariensis*, Steud. (*Digitalis canariensis*, L.). Undershrub with stiff erect sts., 3-4 ft., lightly pilose; lvs. thick, persistent, usually crowded, lanceolate to oblanceolate or somewhat broader, pointed, narrowed to partly clasping base, sharp-serrate, shining above and lighter beneath; fls. yellow-brown, in a dense terminal bracted spike, strongly bilabiate with long acute or obtuse lobes; stamens included under upper lip, the corolla about 1 in. long when fully expanded; calyx-lobes lanceolate: caps. conic, tipped with style.—I. *Sceptrum*, Steud. (*Digitalis Sceptrum*, L.), differs in fls. not bilabiate, the lobes obtuse.

18. **ANARRHINUM**, Desf. Bien. or per. herbs of about 12 species in the Medit. region, one grown in the fl.-garden.—Basal lvs. in rosettes, st.-lvs. alternate: fls. in long slender racemes; calyx 5-parted to base; corolla 2-lipped, with or without spur, throat open; stamens 4: caps. globose, dehiscent at apex; seeds numerous. (Anarrhi-num: Greek *without nose*.)

A. *bellidifolium*, Desf. To 2 ft. high, glabrous, sts. simple or branched above middle: basal lvs. spatulate, deeply toothed, to 3 in. long, st.-lvs. 3-7-parted into linear segms.: fls. blue, limb edged with white, about $\frac{1}{2}$ in. long, spur short and recurved.

19. **MAURANDYA**, Ort. Herbs climbing by coiling petioles and pedicels, with showy fls., comprising about 10 species mostly from Mex.—Lvs. alternate or the lower ones opposite, triangular or halberd-shaped, angular-lobed or coarsely toothed: fls. axillary; calyx 5-parted; corolla-tube slightly gibbous at base, throat open (with palate in *M. antirrhiniflora*), marked with bearded lines; stamens 4: caps. opening by oblique or irregular valves; seeds many. (Maurandya: after Maurandy, promoter of botany at Cartagena, Spain.)—Sometimes spelled Maurandia.

- A. Lvs. entire.
 B. Calyx glabrous.....1. *M. antirrhiniflora*
 BB. Calyx glandular-hairy.....2. *M. Barclaiana*
 AA. Lvs. serrate.
 B. Corolla-tube ventricose, glandular-hairy.....3. *M. erubescens*
 BB. Corolla-tube straight, glabrous.....4. *M. Lophospermum*

1. ***M. antirrhiniflora***, Humb. & Bonpl. (*Antirrhinum maurandioides*, Gray). Plant glabrous: lvs. arrow- or halberd-shaped, about 1 in. long, entire, long-petioled: fls. purple or rose, solitary on filiform pedicels, 1 in. long; sepals lanceolate. Tex. to Calif. and Mex.

2. ***M. Barclaiana***, Lindl. Lvs. hastate, cordate, 1–1½ in. long, entire, the petioles long and twining: fls. about 1½ in. long, on long pedicels, purple, downy outside; sepals glandular-pilose, long-attenuate. (Bears the name of Robt. Barclay, who collected in Mex.) Mex.—Runs into many color forms.

3. ***M. erubescens***, Gray (*Lophospermum erubescens*, D. Don). Plant glandular-hairy: lvs. triangular, to 3 in. long, with petioles as long as blades, serrate: fls. rose-red, 3 in. long, tube somewhat ventricose; sepals ovate and leafy, to 1 in. long. Mex.—Commonly cult. under the name *M. scandens*.

4. ***M. Lophospermum***, Bailey (*M. scandens*, Gray not Pers. *M. erubescens* var. *glabrata*, Johnston. *M. glabrata*, Johnston. *Lophospermum scandens*, D. Don). Branches glandular-pubescent: lvs. triangular-ovate, cordate, unequally serrate, petioles twining: fls. about 3 in. long, on long pedicels, rose-purple, obscurely dotted outside, tube white and straight and glabrous outside; sepals oblong and leafy, 1 in. long. Mex.

20. **ANTIRRHINUM**, L. SNAPDRAGON. About 50 herbaceous species, native in the northern hemisphere, abundant in N. Amer., popular in fl.-gardens and under glass.—Lvs. opposite or upper ones alternate: fls. in terminal racemes or solitary in the axils of lvs.; calyx 5-parted; corolla saccate or gibbous at base, not spurred, upper lip erect and 2-lobed, lower 3-lobed and spreading, throat almost closed by palate; stamens 4: caps. ovoid or globose, opening by pores below the summit. (Antirrhinum: Greek for *like* and *nose*, referring to shape of fls.)

- A. Plant erect: lvs. lanceolate.....1. *A. majus*
 AA. Plant procumbent: lvs. ovate.....2. *A. Asarina*

1. ***A. majus***, L. COMMON or LARGE SNAPDRAGON. Per. 1–3 ft. high but grown as ann., not downy except in fl.-cluster: lvs. lanceolate or oblong-lanceolate, to 3 in. long, entire: fls. to 1½ in. long, in elongated terminal spikes or racemes, in many colors from red and purple to white. Medit. region, escaped in Atlantic states.—Many named forms are in the trade.

2. ***A. Asarina***, L. Procumbent sticky-pubescent per. with sts. to 2 ft. long: lvs. cordate-ovate, 1½–2 in. across, crenate-lobed, long-petioled: fls. solitary, white or pinkish, 1–1½ in. long. (*Asarina*: a folk name for *Antirrhinum*.) S. W. Eu.

21. **CYMBALARIA**, Hill. Nine Old World species of creeping per. herbs, a few grown as ground-cover in greenhouses and the open.—Often united with *Linaria* but differing in the axillary solitary fls. and the palmately-veined lvs. (*Cymbalaria*: from the Greek for *cymbal*.)

- A. Sts. and lvs. glabrous.
 B. Lvs. mostly alternate, prominently lobed.....1. *C. muralis*
 BB. Lvs. mostly opposite, shortly or indistinctly lobed.....2. *C. hepaticifolia*
 AA. Sts. and lvs. hairy.
 B. Peduncles equalling or shorter than lvs.; spur ¼–½ in. long.....3. *C. pallida*
 BB. Peduncles longer than lvs.; spur ½ in. long.....4. *C. æquitribola*

1. ***C. muralis***, Gaertn., Mey. & Scherb. (*Antirrhinum Cymbalaria*, L. *Linaria Cymbalaria*, Mill. *C. Cymbalaria*, Wettst.). KENILWORTH-IVY. Glabrous: sts. trailing and rooting at nodes: lvs. mostly alternate, cordate-obicular or reniform, irregularly 3–7-lobed, on petioles usually longer than blades: fls. about ½ in. long, lilac-blue with yellowish throat: caps. longer than linear-lanceolate sepals. Eu.; nat. Ont. to Pa.—Runs into color variants.

2. ***C. hepaticifolia***, Wettst. (*Antirrhinum hepaticifolium*, Poir. *Linaria hepaticæfolia*, Steud.). Distinguished from *C. muralis* by the lvs. being mostly opposite and with 3–5 short or indistinct lobes, larger fls. and caps. shorter than linear sepals. Corsica.

3. *C. pallida*, Wettst. (*Antirrhinum pallidum*, Ten.). Sts. trailing or at first erect to 4 in.; lvs. opposite, entire or shallowly 3-5-lobed, short-hairy beneath and on petioles; fls. blue-violet with yellow palate, $\frac{1}{2}$ in. long, on peduncles about length of lvs.; caps. equalling or shorter than sepals. Italy.—Material in cult. as *C. pilosa* usually belongs here; *C. pilosa*, Bailey (*Antirrhinum pilosum*, Jacq.), differs in being more hairy, lvs. 5-11-lobed, fls. smaller with shorter spur.

4. *C. æquitribloba*, Cheval. (*Antirrhinum æquitriblobum*, Viv. *Linaria æquitribloba*, Spreng.). Differs from *C. pallida* in peduncles longer than lvs., pale mauve fls. with shorter spur, and caps. longer than sepals. S. Eu.

22. **LINARIA**, Mill. TOADFLAX. Mostly ann. or per. herbs suitable for the fl.-garden; over 150 species widely distributed in temp. parts of the northern hemisphere.—Lvs. opposite or verticillate or the upper ones alternate, pinnate-veined, entire, dentate or lobed; fls. in terminal racemes or spikes, of many colors; calyx 5-parted; corolla with long tube, long-spurred at base, the palate often nearly closing the throat; stamens 4, filaments and style filiform: caps. dehiscent by 1 or more mostly 3-toothed pores or slits below the summit. (Linaria: Latin *linum*, flax, which the lvs. of some species resemble.)

- A. Fls. yellow.
 - B. Lvs. linear 1. *L. vulgaris*
 - BB. Lvs. lanceolate to ovate.
 - c. Length of fls. $\frac{1}{2}$ – $\frac{3}{4}$ in. 2. *L. genistifolia*
 - cc. Length of fls. 1–2 in. 3. *L. dalmatica*
- AA. Fls. not yellow.
 - B. Plant a tufted per. to 6 in. high. 4. *L. alpina*
 - BB. Plant an ann. 1–1½ ft. high.
 - c. Spur slightly shorter than remainder of corolla. 5. *L. bipartita*
 - cc. Spur half as long again as corolla. 6. *L. maroccana*

1. *L. vulgaris*, Mill. BUTTER-AND-EGGS. Per. to 3 ft., slightly glaucous: lvs. linear, to $1\frac{1}{2}$ in. long, sessile, entire: fls. light yellow with orange-bearded palate, $1\frac{1}{4}$ in. long, spur about length of corolla, pedicels longer than calyx. Eu., Asia; nat. in N. Amer.

2. *L. genistifolia*, Mill. (*Antirrhinum genistifolium*, L.). Per. 1–4 ft. high, glabrous: lvs. lanceolate, to $1\frac{1}{2}$ in. long, sessile, entire, glaucous: fls. yellow with orange palate, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, spur about length of corolla, pedicels longer than calyx. Eu.

3. *L. dalmatica*, Mill. (*Antirrhinum dalmaticum*, L.). Robust branching per. to 4 ft., grayish-green and glabrous: lvs. ovate-lanceolate, nearly sessile, entire, somewhat cordate at base: fls. bright yellow with orange-bearded palate, 1–2 in. long, spur about length of corolla. S. E. Eu. Var. *grandiflora*, Boiss., has large very short-pedicelled fls. Var. *macedonica*, Fenzl (*L. macedonica*, Griseb.), differs in the smaller longer-pedicelled fls. and sepals shorter than corolla-tube; Macedonia.

4. *L. alpina*, Mill. Tufted per. with procumbent or ascending sts. to 6 in. high, glabrous, glaucous: lvs. linear or lanceolate, sessile, entire: fls. blue or violet with orange palate, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, spur as long as corolla, pedicels slightly longer than calyx. Mts. of Eu.

5. *L. bipartita*, Willd. Ann., about 1 ft. high, glabrous, glaucous: lvs. linear, 1–2 in. long: fls. violet-purple, $\frac{3}{4}$ in. long, in lax racemes, palate orange-colored, whitish at base, upper lip deeply 2-parted, spur curved, not quite as long as corolla, standing oblique or horizontal, pedicels about three times longer than calyx. Portugal, N. Afr.—Vars. with white and deep purple fls. are cult.

6. *L. maroccana*, Hook. f. Ann. to $1\frac{1}{2}$ ft., glabrous below, viscid-pubescent above: lvs. to $1\frac{1}{2}$ in. long, narrowly linear: racemes many-fld., elongating in fr.; corolla bright violet-purple with small yellow patch on center of palate, spur often half as long again as fl. or pedicel, pointed, nearly parallel to axis of raceme, pedicels longer than calyx. Morocco.

23. **CHÆNORRHINUM**, Lange. Ann. or per. herbs of about 20 species in the Medit. region and Asia, one grown in the rock-garden.—Plants glandular-pubescent: lvs. opposite or the upper alternate, entire: fls. solitary in axils of upper lvs. but forming racemes; calyx 5-parted; corolla 2-lipped, spurred at base, throat with palate but not closed; stamens 4: caps. dehiscent by narrow distal openings. (Chænorrhinum: Greek for *gaping* and *nose*.)

C. origanifolium, Willk. & Lange (*Linaria origanifolia*, DC. *C. glareosum*, Lange). Per. to 10 in.: lvs. oblong to obovate, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, short-petioled: fls. pale purple with yellow palate, sometimes white, $\frac{1}{2}$ in. long, spur shorter than corolla. S. Eu.

24. **ZALUZIANSKYA**, F. W. Schmidt (*Nycterinia*, Don). NIGHT-PHLOX. Nearly 40 species of herbs or subshrubs native in S. Afr., a few sometimes grown in the fl.-

garden.—Lower lvs. opposite, upper alternate, few-toothed, the floral lvs. very small and entire: fls. sessile in terminal spikes, fragrant toward evening; calyx 2-lipped or 2-parted, 5-toothed; corolla with long tube and 5 spreading entire or bifid lobes; stamens 4 (rarely 2 by abortion), 2 inserted on corolla-tube and 2 on throat: caps. oblong, septicidally dehiscent. (Zaluzian-skya: after Adam Zaluziansky von Zaluzian, Polish physician in late 16th century.)

A. Lvs. linear or lower ones lanceolate; outside of corolla-tube short-pubescent. 1. *Z. capensis*
 AA. Lvs. obovate or spatulate; outside of corolla-tube glabrous or nearly so. 2. *Z. villosa*

1. *Z. capensis*, Walp. (*Nycterinia capensis*, Benth.). Erect or ascending ann. to 1½ ft.: lvs. linear or lower lanceolate, ½–2 in. long, obtuse, entire or sparingly toothed: fls. 1–1¾ in. long, white inside, purple-black and short-pubescent outside.

2. *Z. villosa*, F. W. Schmidt (*Z. selaginoides*, Walp. *Nycterinia selaginoides*, Benth.). Pubescent ann. to 1 ft.: lvs. obovate or spatulate, ¼–1 in. long, obtuse, attenuate at base, nearly entire: fls. ½–1 in. long, white or lilac inside, purple and nearly glabrous outside; stamens 2.

25. **TORENIA**, L. Over 30 species of per. or ann. herbs from trop. Asia and Afr., mostly grown as garden annuals.—Plants glabrous, pubescent or hirsute, branching and somewhat decumbent: lvs. opposite, entire, crenate or serrate: fls. in short few-fl'd. racemes or axillary; calyx tubular, plicate or 3–5-winged; corolla-tube cylindrical or often broadened above, 2-lipped, the lower lip 3-lobed; stamens 4, perfect, in 2 pairs of unequal length: caps. oblong, septicidally dehiscent. (Tore-nia: Olaf Toren, Swedish clergyman, discovered *T. asiatica* in China, 1750–1752.)

T. Fournieri, Lind. Much-branched, to 1 ft., glabrous, sts. 4-angled: lvs. ovate or ovate-cordate, serrate, 1½–2 in. long; petiole more than half as long as blade: fls. in upper axils or forming terminal racemes, on stout pedicels; calyx rather inflated, broadly 5-winged, obscurely ciliate; corolla-tube pale violet, yellow on back; upper lip pale blue, obscurely 2-lobed, lower lip of 3 purplish-blue rounded lobes the central one with yellow blotch at base. (Named for Eug. Fournier, page 43.) Cochin-China.—There are white-fl'd. vars. and also forms of compact habit. Other species of *Torenia* occasionally met with in cult. are *T. asiatica*, L., with the corolla-tube dark purple and a pale purple limb with a dark blotch on 3 of the 4 lobes, and *T. flava*, Buch.-Ham. (*T. Baillonii*, Godefroy), with yellow tube red-purple above and yellow limb with purple eye.

26. **MIMULUS**, L. MONKEY-FLOWER. About 150 species of decumbent or erect herbs or sometimes shrubs, native in N. and S. Amer., Asia, Australia, S. Afr., particularly numerous in W. N. Amer., a few grown in the fl.-garden.—Plants glabrous or pilose, often viscid or glandular-pubescent: lvs. opposite, entire or dentate: fls. solitary, axillary or in terminal racemes, usually showy; calyx tubular, 5-angled, 5-toothed; corolla-tube cylindrical; upper lip 2-lobed, reflexed or erect; lower 3-lobed, spreading; stamens 4, inserted on corolla-tube; style filiform with 2-lobed sensitive stigma: caps. oblong or linear, loculicidally dehiscent. (Mim-ulus: Latin diminutive of *mimus*, mimic actor, referring to the grinning fls.)

- A. Plant woody or shrubby.
 - B. Calyx and upper part of st. white-woolly or villous. 1. *M. longiflorus*
 - BB. Calyx and upper part of st. glabrous or only pubescent.
 - C. Color of fls. yellow: lvs. densely pubescent beneath. 2. *M. aurantiacus*
 - CC. Color of fls. red: lvs. sparsely pubescent beneath. 3. *M. puniceus*
- AA. Plant herbaceous.
 - B. Foliage viscid-pubescent.
 - C. Fls. yellow. 4. *M. moschatus*
 - CC. Fls. red.
 - D. Stamens exserted; corolla strongly bilabiate. 5. *M. cardinalis*
 - DD. Stamens included; corolla with nearly equal lobes. 6. *M. Lewisii*
 - BB. Foliage not sticky.
 - C. Corolla with open throat.
 - D. Mature fls. yellow, often spotted with red or purple. 7. *M. luteus*
 - DD. Mature fls. copper-colored. 8. *M. cupreus*
 - CC. Corolla bilabiate, with throat closed or nearly so.
 - D. Fls. yellow. 9. *M. guttatus*
 - DD. Fls. blue. 10. *M. ringens*

1. *M. longiflorus*, Grant (*Diplacus longiflorus*, Nutt. *M. glutinosus* var. *brachypus*, Gray). Low shrub to 3 ft., much-branched, sts. glandular-pubescent: lvs. lanceolate, to 3 in. long, entire or denticulate, sessile, pubescent beneath: fls. cream-color to salmon-yellow, 2–3 in. long, lobes irregularly cut, short-pedicelled; calyx and pedicels villous, the calyx-throat much expanded; stamens included. S. Calif.

2. *M. aurantiacus*, Curt. (*M. glutinosus*, Wendl. *Diplacus glutinosus*, Nutt.). Shrub 2-6 ft. high: lvs. mostly narrow-oblong, to 2 in. long, entire or denticulate, sessile, the margins becoming revolute, densely pubescent beneath; fls. deep yellow, 1-1½ in. long, short-pedicelled, the spreading lobes toothed or notched; calyx glabrous or only slightly pubescent; stamens somewhat exserted. S. Ore. to S. Calif.

3. *M. puniceus*, Steud. (*M. glutinosus* var. *puniceus*, Gray. *Diplacus puniceus*, Nutt.). Very similar to the above but with narrower lvs. which are only sparsely pubescent beneath, and red fls. S. Calif.

4. *M. moschatous*, Dougl. MUSK-PLANT. Per. by spreading and creeping stolons, slimy viscid-villous, with a musky odor: lvs. oblong-ovate, to 1½ in. long, entire or denticulate, short-petioled: fls. pale yellow, lightly dotted with brown, about ¾ in. long, long-pedicelled: corolla-lobes nearly equal; stamens included, anthers pubescent. Rocky Mt. and Pacific Coast states.

5. *M. cardinalis*, Dougl. Per. with erect or weak sts. to 1 ft. long, villous and viscid: lvs. obovate, 1-4½ in. long, sharply toothed, sessile: fls. scarlet, rarely yellow, 1½-2 in. long, on elongated pedicels, the tube longer than the limb which is markedly bilabiate; stamens exserted, anthers bearded. Utah to Ore. and Lower Calif.

6. *M. Lewisii*, Pursh. Per. to 2½ ft., viscid-pubescent: lvs. oblong, 1-3 in. long, irregularly toothed, sessile: fls. rose-red or pink with lines in throat, varying to white, to 2 in. long, on long pedicels, corolla-lobes nearly equal; stamens included, anthers somewhat hairy. (Type collected by Meriwether Lewis on Lewis & Clark Expedition.) Alta. to Calif.

7. *M. luteus*, L. Glabrous per. with prostrate or decumbent sts. to 1 ft. long, rooting at nodes: lvs. broad-ovate, 1 in. long, sharply toothed, 5-7-nerved from base, lower short-petioled, upper sessile: fls. yellow, often with red or purple spots, in loose few-fl. racemes, long-pedicelled, 1-2 in. long. Chile.—There are several color forms, as var. *rivularis*, Lindl., in which one lobe has a large brown spot, and var. *Youngeanus*, Hook., each lobe with a spot, and var. *variegatus*, Hook., with pale yellow throat and the margins of the lobes pinkish-purple. Under the name *M. tigrinus* are offered the large-fl. bright colored crosses of *M. luteus* and its vars. and *M. guttatus*.

8. *M. cupreus*, D'Ombra. Of more compact growth than *M. luteus*, the lvs. 3-5-nerved, the fls. becoming brilliant copper-color and with more expanded throat. Chile.

9. *M. guttatus*, DC. (*M. Langsdorffii*, Donn). Glabrous or pubescent ann. or per. to 1½ ft. high, sts. rooting at nodes: lvs. ovate to oblong-lanceolate, ½-6 in. long, irregularly toothed, lower long-petioled, upper sessile: fls. yellow, generally with purple or brown dots in throat, about 1 in. long, in many-fl. close racemes, pedicels usually shorter than fls.; corolla bilabiate, with closed throat; calyx much inflated in fr. Alaska to Mex.

10. *M. ringens*, L. ALLEGHENY MONKEY-FLOWER. Glabrous per. with 4-angled sts. to 4 ft. high: lvs. oblong, 1-4 in. long, toothed, usually sessile: fls. blue varying to pink or white, 1-1½ in. long, short-pedicelled; corolla bilabiate with throat nearly closed; stamens slightly exserted. Ont. to Fla. and Tex.

27. MAZUS, Lour. Low herbs, sometimes grown in rock-gardens or as ground-cover, of about 6 species in Asia, Australia and Malay Archipelago.—Lower lvs. opposite or radical, upper mostly alternate, toothed or incised: fls. blue or white, in terminal subsecund racemes; calyx campanulate, 5-lobed; corolla 2-lipped, the upper erect and 2-lobed, the lower much larger, spreading, 3-lobed, with 2 prominent ridges in throat, the tube short or exceeding the calyx; stamens 4, inserted on corolla-tube; style 2-lobed: caps. globose or compressed, loculicidally dehiscent. (Mazus: Greek for *teat*, referring to the ridges of corolla.)

- A. Fls. blue, with large lower lip.
- B. Sts. rooting at nodes.....1. *M. reptans*
- BB. Sts. not rooting.....2. *M. japonicus*
- AA. Fls. white, lower lip not large.....3. *M. Pumilio*

1. *M. reptans*, N. E. Br. Tufted per. 1-2 in. high, the sts. rooting at nodes: lvs. lanceolate to elliptic, to 1 in. long, with few coarse teeth: fls. ¾ in. long, purplish-blue, large lower lip spotted with white, yellow and purple. Probably Himalayas.—Much of the material grown as *M. rugosus* belongs here.

2. *M. japonicus*, Kuntze (*M. rugosus*, Lour.). Low trailing per., the flowering sts. sometimes to 1 ft. high: lvs. obovate-spatulate, to 2½ in. long, coarsely crenate-dentate: fls. ½-¾ in. long, blue, the ridges of the lower lip brown-spotted and bearded with club-shaped hairs. E. Asia.

3. *M. Pumilio*, R. Br. Per. with creeping underground sts.: lvs. obovate-spatulate, tufted, ¾-3 in. long, entire or coarsely toothed: fls. ¼-½ in. long, white or bluish-white with yellow center. (*Pumilio*: a dwarf.) New Zeal., Australia.

28. **PHYGELIUS**, E. Mey. Two species of small shrubs from S. Afr., one grown in greenhouses or planted out-of-doors.—Lvs. glabrous, opposite or sometimes upper ones alternate, petioled, crenate: fls. in terminal panicles, scarlet, drooping; calyx 5-parted; corolla-tube elongated, curved or almost straight, with 5 nearly equal rounded lobes; stamens 4, exserted; style filiform, exserted: caps. septicidally dehiscent. (Phyge-lius: Greek *sun flight*, referring to its supposed shade-loving habit.)

P. capensis, E. Mey. CAPE-FUCHSIA. To about 3 ft., sts. 4-angled or narrowly winged: lvs. ovate or ovate-lanceolate, 1–5 in. long, bluntly small-toothed: fls. showy, 2 in. long, on ends of straight-spreading peduncles forming a loose infl., corolla-tube somewhat incurved, slender. Cape of Good Hope.—Not hardy N.

29. **RUSSELIA**, Jacq. CORAL-BLOW. Twenty species of shrubs in trop. Amer., grown in greenhouses and in the open far S.—Lvs. opposite or verticillate, often reduced to scales on the branches: fls. in bracteate dichotomous cymes, many-fl. or sometimes only 1, red; calyx deeply 5-cleft or 5-parted; corolla-tube cylindrical, somewhat 2-lipped, 5-cleft, the lobes rounded; stamens 4, included: caps. subglobose, septicidally dehiscent. (Russe-lia: Alexander Russell, English physician and traveler, died 1768.)

R. equisetiformis, Schlecht. & Cham. (*R. juncea*, Zucc.). CORAL-PLANT. FOUNTAIN-PLANT. Much-branched shrub 1–4 ft. high, glabrous, branches rush-like, nodding or pendulous at top, sts. striate: lvs. ovate or linear-lanceolate, mostly reduced to minute bracts on the branches: fls. about 1 in. long, peduncles elongated, 1–3-fl. Mex.; nat. in Fla. and W. Indies.—**R. sarmentosa**, Jacq., may be distinguished by its many-fl. short peduncles and the lvs. never reduced to scales. Reputed hybrids between *R. equisetiformis* and *R. sarmentosa* are known under the garden names of *R. Lemoinei* and *R. elegantissima*; these are more floriferous forms.

30. **DIASCIA**, Link & Otto. About 50 species of herbs from S. Afr., one grown in fl.-gardens.—Ann. or rarely per. tender herbs, diffuse or erect: lvs. usually opposite: fls. violet or rose, borne in axillary or fascicled racemes at ends of branches, racemes leafy or bracted; calyx 5-parted; corolla-tube almost none, limb flat or concave, 2-lipped, upper lip 2-lobed, lower 3-lobed, all lobes flat and broad, lower lip 2-spurred; stamens 4; style filiform: caps. subglobose or elongated, septicidally dehiscent; seeds numerous. (Dias-cia: from Greek for *two* and *pouch*, referring to the two-spurred corolla.)

D. Barberæ, Hook. f. TWINSPUR. Ann., erect, about 1 ft. high: lvs. ovate, to 1½ in. long, toothed, petioled or upper ones sessile: fls. in terminal racemes to 6 in. long, slender-pedicelled, rosy-pink with yellow spot on throat, ½ in. across, lower lobe of corolla much larger than others, the spurs about as long as lower lobe; anthers yellow. (Bears the name of Mrs. Barber, who sent seeds from S. Afr.)

31. **ALONSOA**, Ruiz & Pav. MASK-FLOWER. Herbs or shrubs from trop. Amer., of 10 or more species, grown in fl.-gardens.—Glabrous except infl., sts. 4-sided: lvs. opposite or whorled in 3's, entire or serrate: fls. red, in terminal racemes; calyx 5-parted; corolla turned upside down by torsion of pedicel, bringing the lower lobe uppermost, flat-rotate, tube almost none; stamens 4, with short filaments: caps. ovate or oblong, obtuse, septicidally 2-valved; seeds numerous, small. (Alonso-a: for Alonso Zanoni, Spanish official at Bogota about 1798.)

A. Warscewiczii, Regel (*A. grandiflora*, Hort. *A. compacta*, Hort.). To 3 ft., very bushy, erect: lvs. ovate-lanceolate, somewhat cordate at base, simple- or double-toothed, bright green above, paler beneath: fls. cinnabar- or scarlet-red, in loose racemes at ends of branches; upper lip four to five times longer than calyx; anthers three to four times shorter than curved filaments; style (with stigma) about as long as filaments. (Named for J. von Warscewicz, page 291.) Peru.—Runs into cultivars. Probably *A. Mutisii* of the trade belongs here.

32. **ANGELONIA**, Humb. & Bonpl. About 25 species of herbs or subshrubs native in trop. Amer., especially Brazil, grown in greenhouses in the N. or out-of-doors in warm climates.—Lvs. opposite or upper ones alternate: fls. blue, solitary in the axils or in terminal racemes; calyx 5-parted or 5-toothed; corolla-tube almost

none, upper lip 2-lobed, lower 3-lobed; throat ventricose, with a 2-toothed protuberance at lower end; stamens 4, with short filaments: caps. globose or elliptical, 2-valved, loculicidally dehiscent, rarely indehiscent. (Angelo-nia: from *angelon*, Venezuelan name of one of the species.)

- A. Plant sticky-pubescent 1. *A. salicariæfolia*
 AA. Plant glabrous 2. *A. angustifolia*

1. *A. salicariæfolia*, Humb. & Bonpl. Sticky-pubescent per. to 2 ft.: lvs. lanceolate to linear-oblong, to 3 in. long, toothed, nearly sessile: fls. blue, $\frac{3}{4}$ in. across, on slender pedicels in long leafy-bracted racemes, lower corolla-lobes oblong. N. S. Amer., W. Indies.—This is the *A. grandiflora* of gardens.

2. *A. angustifolia*, Benth. Differs from the above in being glabrous, lvs. narrower, and lower corolla-lobes obovate. W. Indies, Mex.

33. **NEMESIA**, Vent. Tender herbs or subshrubs of about 50 species from S. Afr., a few from trop. Afr., attractive for the fl.-garden.—Lvs. opposite: fls. variable in color, in terminal racemes or rarely solitary in the axils; calyx 5-parted; corolla-tube short with spur or sac in front; lower lip entire or emarginate with palate at base, upper 4-cleft; stamens 4, the 1-celled anthers often cohering about the stigma: caps. septicidally dehiscent, with boat-shaped valves. (Nemes-ia: old name used by Dioscorides for some sort of snapdragon.)

- A. Fls. with sac or pouch at base 1. *N. strumosa*
 AA. Fls. with spur at base 2. *N. versicolor*

1. *N. strumosa*, Benth. Ann. 1–2 ft. high: st.-lvs. lanceolate or linear, dentate, sessile, lower to 3 in. long; fls. $\frac{3}{4}$ –1 in. across, in terminal racemes to 4 in. long, white or in shades of yellow and purple, often purple marked on the outside, the bearded throat spotted on a yellow ground, with pouch at base. S. Afr.—Runs into many vars., var. *Suttonii*, Hort., being a series of improved forms.

2. *N. versicolor*, E. Mey. Ann. to about 1 ft.: st.-lvs. few, oblong, lanceolate or linear, to $1\frac{1}{2}$ in. long, entire or toothed, sessile: fls. about $\frac{1}{2}$ in. long, in terminal racemes to 3 in. long, variable in color, throat with 2 callosities, pubescent; spur incurved or nearly straight, about as long as lower lip. S. Afr.—There is a free-flowering compact race, var. *compacta*, Hort., 8 in. to 1 ft. high. Hybrids between the spurred and saccate forms occur in cult.

34. **COLLINSIA**, Nutt. Hardy ann. herbs, of more than 20 species, native mostly in W. N. Amer.—Lvs. opposite or verticillate in 3's: fls. in axils of lvs., solitary or in umbel-like clusters; calyx campanulate, 5-cleft; corolla with short tube, bilabiate, upper lip 2-lobed, recurved, lower lip 3-lobed, the side lobes drooping or spreading, inclosing the 4 stamens; fifth stamen reduced to a gland at base of corolla-tube; style filiform, capitate: caps. septicidally dehiscent; seeds few. (Collin-sia: after Zaccheus Collins, 1764–1831, Philadelphia botanist.)

- A. Pedicels very short, almost none 1. *C. heterophylla*
 AA. Pedicels about as long as fls. 2. *C. grandiflora*

1. *C. heterophylla*, R. Grah. (*C. bicolor*, Benth.). From 1–2 ft. high, glabrous, hairy or viscid: lvs. oblong or lanceolate, to 2 in. long, dentate or entire, upper sessile: fls. in 2–7-fl. whorls, $\frac{1}{2}$ – $\frac{3}{4}$ in. long; pedicels shorter than calyx-lobes; lower lip of corolla violet or rose-purple, upper lip white; upper filaments with basal appendage, bearded half their length. Calif.—Several vars. are in cult. with variegated and white fls.

2. *C. grandiflora*, Dougl. BLUE-LIPS. To 15 in., glabrous or pubescent: lvs. oblong to linear, to $1\frac{1}{4}$ in. long, finely toothed or entire, sessile: fls. in 3–7-fl. whorls, $\frac{1}{2}$ – $\frac{1}{2}$ in. long; pedicels about length of fls.; lower lip deep blue or violet, upper lip white to purple, reflexed; filaments not appendaged, slightly bearded at base. B. C. to Calif.

35. **PAULOWNIA**, Sieb. & Zucc. About 10 species of deciduous Chinese trees, one planted for ornament.—Lvs. opposite, entire or 3-lobed: fls. in terminal panicles; calyx deeply 5-cleft; corolla-tube elongated, enlarged above, lobes 5, spreading obliquely, somewhat unequal; stamens 4: caps. loculicidally dehiscent by 2 valves; seeds numerous, small, winged. (Paulow-nia: Anna Paulowna, 1795–1865, princess of the Netherlands.)—The genus has strong affinities with Bignoniaceæ.

P. tomentosa, Steud. (*P. imperialis*, Sieb. & Zucc.). Tree to 40 ft., with the habit of catalpa: lvs. broadly cordate-ovate, 5–10 in. or more long, entire or 3-lobed, acuminate, long-petioled, pubescent above, tomentose beneath: fls. 2 in. or more long, showy, pale violet darker spotted inside, fragrant, in many-fl. terminal panicles to 1 ft. long, appear-

ing before the lvs.; pedicels and calyx densely rusty-tomentose; calyx-lobes short, rounded; caps. woody, ovoid, $1\frac{1}{2}$ –2 in. long, beaked. China; cult. in Japan; escaped in U. S. from S. N. Y. to Ga.—There are vars. with whitish fls. and with lvs. more densely yellow-tomentose beneath.

Fig. 180. BIGNONIACEÆ. A, *Catalpa bignonioides*: Aa, flower, $\times \frac{1}{2}$; Ab, flower, perianth expanded, $\times \frac{1}{4}$; Ac, pistil with two stamens, $\times 1$; Ad, ovary, cross-section, $\times 4$. B, *Campsis radicans*: Ba, flowering branch, $\times \frac{1}{8}$; Bb, pistil with ovary in vertical section, $\times 1$; Bc, capsule, $\times \frac{1}{8}$; Bd, seed, $\times \frac{1}{2}$.

180. BIGNONIACEÆ. BIGNONIA FAMILY

Trees, shrubs, and woody vines, or rarely herbs, of about 100 genera and 600 or more species distributed in trop. regions, a few extending into the temp. zone.—Lvs. opposite or rarely alternate, simple or compound, exstipulate; fls. bisexual, more or less irregular, mostly showy, in terminal or axillary panicles or racemes; calyx tubular, truncate or 5-toothed, sometimes spathe-like; corolla gamopetalous, campanulate, funnelform or tubular, 5-lobed, seldom somewhat 2-lipped; fertile stamens commonly 4, inserted on corolla-tube and alternate with its lobes, sometimes 2 or the fifth stamen anther-bearing; hypogynous disk present; ovary superior, 1- or 2-celled, with numerous ovules on parietal placenta; style slender, with 2-lobed stigma: fr. a loculicidally or septifragally (valves breaking away from partition) dehiscent caps., rarely indehiscent; seeds compressed, usually winged.

- A. Habit climbing.
 - B. Ovary 2-celled.
 - C. Climbing by tendrils.
 - D. Plant with 3-parted tendrils.
 - E. Caps. not prickly.
 - F. Stamens included: corolla-lobes without white margins.
 - G. Corolla to 2 in. long.
 - H. Tendrils not claw-like but climbing by small disks. 1. BIGNONIA
 - HH. Tendrils claw-like or hooked. 2. DOXANTHA
 - GG. Corolla to 4 in. long. 3. PHÆDRANTHUS
 - FF. Stamens slightly exserted: corolla-lobes (in ours) with prominent white velutinous margins. 4. PYROSTEGIA
 - EE. Caps. densely covered with prickles: tendrils filiform. 5. PITHECOTENIUM
 - DD. Plant with simple tendrils. 6. CLYTOSTOMA
 - Cc. Climbing but not by tendrils.
 - D. Stamens exserted. 20. TECOMARIA
 - DD. Stamens included.
 - E. Fls. scarlet or orange: climbing by aerial rootlets. 7. CAMPSIS
 - EE. Fls. white or pink: climbing without rootlets.
 - F. Fr. short-oblong: calyx not inflated. 8. PANDOREA
 - FF. Fr. long-linear: calyx inflated. 9. PODRANEA
 - BB. Ovary 1-celled. 10. ECCREMOCARPUS
- AA. Habit upright.
 - B. Ovary 1-celled: fr. indehiscent.
 - C. Lvs. simple. 11. CRESENTIA
 - Cc. Lvs. pinnate. 12. KIGELIA
 - BB. Ovary 2-celled: fr. dehiscent.
 - C. Plant an herb: caps. opening only or more deeply along ventral suture. 13. INCARVILLEA
 - Cc. Plant a shrub or tree: caps. separating into 2 valves.
 - D. Lvs. simple or digitately compound.
 - E. Fertile stamens 2. 14. CATALPA
 - EE. Fertile stamens 4.

- F. Seeds not winged, long-hairy: lvs. simple 15. *CHILOPSIS*
 FF. Seeds winged: lvs. (in ours) compound 16. *TABEUTIA*
 DD. Lvs. pinnately compound.
 E. Calyx spathe-like, splitting down one side 17. *SPATHODEA*
 EE. Calyx campanulate.
 F. Staminodia about as long as fertile stamens: fls. blue or violet 18. *JACARANDA*
 FF. Staminodia short: fls. yellow or scarlet.
 G. Stamens included 19. *STENOLOBIUM*
 GG. Stamens exerted 20. *TECOMARIA*

1. **BIGNONIA**, L. (*Doxantha*, Schum. not Miers. *Anisostichus*, Bur.). Woody tendril-climber, desirable because of the profusion and beauty of the fls., grown in the open in warmer parts of the country and also under glass; a single species native to S. E. U. S.—Vines with opposite 2-foliolate lvs., the terminal lft. reduced to a tendril: fls. large, in axillary cymes; calyx campanulate, the limb undulate, truncate or slightly 5-toothed; corolla-tube abruptly much-expanded above the calyx, the limb somewhat 2-lipped, with 5 rounded lobes; stamens 4, paired, included, inserted near base of corolla, the sterile rudiment of a fifth sometimes present; fr. a 2-celled septifragal caps. flattened parallel to the partition, the valves thickened; seeds winged. (Bigno-nia: the Abbé Jean Paul Bignon, 1662–1743, court librarian to Louis XIV.)

B. capreolata, L. (*B. crucigera*, L. in part. *Anisostichus capreolata*, Bur. *Doxantha capreolata*, Miers). TRUMPET-FLOWER. CROSS-VINE. QUARTER-VINE. Evergreen climber to 50 ft. or more, glabrous: lvs. petioled, ending in a branched tendril that clings by small disks, the 2 lfts. stalked, oblong or ovate, 2–6 in. long, entire, acute or acuminate: cymes many, 2–5-fld., short-peduncled; corolla yellow-red and lighter within, tubular, 2 in. long, with a stout limb: caps. very flat, 4–7 in. long; seeds broadly winged laterally, narrowly winged above and below. Va. to Fla. and La.

2. **DOXANTHA**, Miers (*Bignonia*, Auth. not L.). Shrubby climbers grown out-of-doors in the S. for their large showy fls., in greenhouses farther N.; 2 species from the W. Indies and Mex. to S. Brazil and Argentina.—Lvs. opposite, 2-foliolate, with a terminal 3-cleft claw-like tendril, or 3–1-foliolate; lfts. oblong, sometimes toothed: fls. conspicuous, solitary or in short panicles; calyx campanulate, truncate, with irregular or lobed border; corolla campanulate-funnelform, the limb with 5 often unequal lobes; stamens paired, included; ovary almost 4-angled, with numerous seeds in each cell: caps. elongate-linear, with leathery valves; seeds elliptic with membranaceous wings. (*Doxan-tha*: Greek *glory-flower* in allusion to its beauty.)

D. Unguis-cati, Rehd. (*D. Unguis*, Miers. *Bignonia Unguis-cati*, L. *B. Tweediana*, Lindl. *Batocydia Unguis*, Mart.). CATS-CLAW (in Latin *Unguis-cati*). Lvs. persistent, terminated by a 3-parted claw-like tendril; lfts. 1 pair, lanceolate and pointed, cordate, 3 in. or less long: fls. trumpet-shaped, 2 in. long, allamanda-like; corolla-tube clear bright yellow, the throat with orange lines; limb 2–4 in. across, the lobes spreading, the upper surface orange-yellow: fr. 1 ft. or more long and about ½ in. wide. W. Indies to Argentina.—The plant grown under the name *Bignonia Chamberlaynii* belongs here. The true *Bignonia Chamberlaynii* of Sims is properly *Anemopægma Chamberlaynii*, Bur. & Schum. (*A. racemosum*, Mart.), and is not cult.; it has simple tendrils, oblong or ovate lfts. to 7 in. long, fls. to 3 in. long, and oval fr. to 6 in. long; Brazil.

3. **PHÆDRANTHUS**, Miers. One evergreen climbing shrub from Mex., grown in warm countries.—Lvs. compound, of 2 entire lfts. and a 3-parted filiform tendril: fls. in terminal racemes; calyx leathery and tomentose, campanulate, with 5 unequal short teeth; corolla tubular-funnelform, curved, the lobes imbricate in bud; stamens 4, included; disk fleshy; ovary tomentose, with many ovules in several rows. (*Phædran-thus*: Greek for *gay* and *flower*.)

P. buccinatorius, Miers (*Pithecoctenium buccinatorium*, DC. *Bignonia Cherere*, Lindl. *B. buccinatoria*, Mairet). Branches 4-angled: lfts. elliptic to ovate-oblong, 2–4 in. long, cuspidate or obtuse, glabrous above, tomentose beneath when young, petioles pubescent: fls. blood- or purple-red, yellow at base, 4 in. long, pendulous, with spreading emarginate lobes. Mex.

4. **PYROSTEGIA**, Presl. Four species of evergreen climbing shrubs native in S. Amer., cult. in greenhouses and out-of-doors S.—Lvs. of 2–3 lfts. and filiform 3-parted tendrils: fls. in terminal panicles; calyx campanulate or tubular, truncate

or toothed; corolla tubular-funnelform, curved, the lobes valvate in bud; stamens exerted; disk annular; ovary linear, the many seeds arranged in 2 rows or zigzag: caps. long-linear, with leathery valves. (Pyroste-gia: Greek for *fire* and *roof*, referring to color of fls. and shape of upper lip.)

P. ignea, Presl (*Bignonia ignea*, Vell. *B. venusta*, Ker. *P. venusta*, Bail.). Branchlets striate or somewhat angled: lfts. ovate to ovate-oblong, 2-3 in. long, short or abruptly acuminate, broadly cuneate at base, petioles pubescent: fls. crimson-orange, 2-3 in. long, in many-fld. pendulous panicles; calyx glandular, ciliate; corolla-lobes oblong, obtuse, reflexed, with prominent white velutinous margins: fr. to 1 ft. long. Brazil.

5. PITHECOCTENIUM, Mart. Evergreen tendril-climbing shrubs, of about 20 species from Mex. to Argentina.—Lvs. opposite, 3-foliolate or the terminal lft. replaced by a filiform 3-parted tendril: fls. in terminal racemes or panicles; calyx leathery and tomentose, campanulate, truncate or with small teeth; corolla campanulate, curved, leathery, the lobes imbricate in bud; stamens included; disk large; ovary warty, with many ovules in several rows: caps. large and broad, densely covered with prickly warts, the persistent septum with enlarged margin. (Pithecoctenium: Greek *monkey's comb*, referring to the spiny fr.)

P. cynanchoides, DC. (*P. clematideum*, Griseb.). Branchlets slightly hairy: lfts. ovate, 1-2 in. long, long-acuminate, subcordate and ciliate at base, glabrous above; fls. white, 1½-2 in. long, pubescent outside, in few-fld. racemes, with funnelform tube and spreading limb: fr. covered with yellowish spines, 2½ in. long. Argentina, Uruguay.

6. CLYTOSTOMA, Bur. Climbing evergreen shrubs, of about 8 species in S. Amer.—Lvs. of 2 entire lfts., the terminal lft. usually represented by a simple slender tendril: fls. in axillary or terminal panicles; calyx campanulate, with 5 subulate teeth; corolla funnelform-campanulate, the rounded lobes imbricated in the bud; stamens included; disk short; ovary warty, the many ovules in 2 rows: caps. broad and prickly. (Clytos-toma: Greek for *splendid* and *mouth*, alluding to the beautiful fls.)

C. callistegioides, Bur. (*Bignonia callistegioides*, Cham. *B. speciosa*, R. Grah.). Lfts. elliptic-oblong, 2-4 in. long, acuminate, glabrous and lustrous, undulate: fls. lavender, streaked, 3 in. long; calyx-lobes produced into long linear points; limb of corolla 2-3 in. across, the spreading lobes broadly oval and wavy: fr. 3-5 in. long, prickly, with many flat winged seeds. S. Brazil, Argentina.—The plant known to hort. as *Bignonia violacea* belongs to this species.

7. CAMPSIS, Lour. TRUMPET-CREEPER. Deciduous woody vines; 1 species in N. Amer. and 1 in China and Japan.—Climbing by aerial rootlets: lvs. opposite, odd-pinnate, the lfts. toothed: fls. large, orange or scarlet, in terminal clusters or panicles in summer or early autumn; calyx tubular-campanulate, leathery, unequally 5-toothed; corolla funnelform-campanulate, enlarged above the calyx, slightly 2-lipped, with 5 spreading lobes; stamens 4, 2 longer and 2 shorter; ovary 2-celled, surrounded at base by a large disk: fr. an elongated caps. loculicidally dehiscent, the 2 valves separating from the septum to which the seeds are attached; seeds numerous, compressed, with 2 large translucent wings. (Camp-sis: Greek *curve*, referring to the curved stamens.)

A. Lfts. 9-11, pubescent beneath at least along the midrib: calyx-teeth short.....1. *C. radicans*
AA. Lfts. 7-9, glabrous beneath: calyx 5-lobed to the middle.....2. *C. grandiflora*

1. **C. radicans**, Seem. (*Bignonia radicans*, L. *Tecoma radicans*, Juss.). TRUMPET-VINE. Climbing to 30 ft. or more: lfts. 9-11, oval to ovate-oblong, 1½-2½ in. long, acuminate, serrate, dark green above, pale and pubescent beneath (at least along the midrib): fls. usually orange with scarlet limb, about 3 in. long; corolla-tube almost three times as long as the short-toothed calyx: caps. cylindric-oblong, 3-5 in. long, keeled along the sutures, stalked, beaked at apex. Pa. to Fla. and Tex.

2. **C. grandiflora**, Loisel. (*Bignoniagrandiflora*, Thunb. *B. chinensis*, Lam. *C. chinensis*, Voss. *Tecoma grandiflora*, Loisel. *T. chinensis*, Koch). CHINESE TRUMPET-CREEPER. Aerial rootlets few or none: lfts. usually 7-9, ovate to ovate-lanceolate, 1½-2½ in. long, serrate, glabrous beneath: fls. scarlet, the corolla shorter and broader than in the preceding species, about 2 in. across; calyx 5-lobed to the middle, one-half to about as long as the corolla-tube: caps. obtuse at apex. China, Japan.

8. **PANDOREA**, Spach. Seven species of ornamental woody vines from Australia to Malay Archipelago.—Climbing without tendrils or roots: lvs. persistent, opposite, odd-pinnate; lfts. entire or serrate; fls. white or pink, in terminal few- or many-fl. panicles; calyx small, campanulate, 5-toothed; corolla funnellform-campanulate, with imbricate lobes; stamens 4, didynamous, included; disk thick, ring-like; ovary ovoid, the seeds in many series: pod oblong, with woody valves which dehisce into 2 longitudinal segms.; seeds broadly elliptic, winged. (Pandorea: Pandora, Greek mythological name.)

A. Panicles many-fl.; corolla $\frac{3}{4}$ in. long. 1. *P. pandorana*
 AA. Panicles rather few-fl.; corolla $1\frac{1}{2}$ -2 in. long. 2. *P. jasminoides*

1. *P. pandorana*, VanSteenis (*Bignonia pandorana*, Andr. *B. australis*, Ait. *Tecoma australis*, R. Br. *P. australis*, Spach). WONGA-WONGA VINE. High climbing: lfts. 3-9 or more, ovate to lanceolate, 1-3 in. long, acuminate but bluntly pointed, entire or sometimes coarsely crenate, glabrous, shining above: fls. $\frac{3}{4}$ in. long, yellowish-white, the throat spotted violet, in many-fl. panicles; corolla-limb spreading, 5-lobed: fr. 1-3 in. long, pointed. Australia, Malaysia.

2. *P. jasminoides*, Schum. (*Tecoma jasminoides*, Lindl. *Bignonia jasminoides*, Hort.). BOWER-PLANT of Australia. Lfts. 5-9, almost sessile, ovate to lanceolate, 1-2 in. long, acuminate but bluntly pointed, entire, glabrous: fls. white, sometimes suffused with pink, usually rosy-pink in the throat, $1\frac{1}{2}$ -2 in. long, in few-fl. panicles; corolla-limb large and spreading, with crenate lobes: fr. 2-4 in. long, pointed. Australia.

9. **PODRANEA**, Sprague. Two African climbing shrubs, sometimes planted in warm regions.—Distinguished from Pandorea by the inflated calyx, oblong ovary and the long-linear caps. with flexible leathery entire valves. (Podra-neæ: anagram of Pandorea.)

P. Ricasoliana, Sprague (*Tecoma Ricasoliana*, Tanfani. *T. Mackenii*, W. Wats. *Pandorea Ricasoliana*, Baill.). Lfts. 7-9, short-petioled, ovate, 1-2 in. long, acute or acuminate, serrate, glabrous, dark green above and pale beneath: fls. 2 in. long, light pink striped with red, in loose terminal panicles; corolla with spreading 5-lobed limb, glabrous: fr. linear, terete, 10-12 in. long. (Presumably named from the gardens of Baron Ricasoli, Italy.) S. Afr.

10. **ECCREMOCARPUS**, Ruiz & Pav. Tendril-climbers grown for their showy fls.; 3 or 4 species from Peru and Chile.—Tall-climbing shrubs grown as annuals in the N.: lvs. opposite, 2-parted or -pinnate, terminated by a branching tendril: fls. more or less irregular, yellow, scarlet, or orange, mostly racemose; calyx campanulate, 5-parted; corolla-tube elongate, the limb more or less 2-lipped or small and nearly entire; stamens 4, didynamous, included; disk annular: fr. an ovate or elliptic loculicidal 1-celled caps. (Eccremocar-pus: Greek *pendent fruit*.)

E. scaber, Ruiz & Pav. Per. about 10 ft. high, blooming from seed the first year, glabrous: lvs. bipinnate; lfts. ovate, $\frac{1}{8}$ - $1\frac{1}{4}$ in. long, obliquely cordate, entire or serrate, obtuse or acute: fls. 1 in. long, orange, in racemes 4-6 in. long; corolla-tube narrow at base, the upper half gibbous and constricted just below the narrow limb which has 5 short rounded lobes: caps. $1\frac{1}{2}$ in. long. Chile.

11. **CRESCENTIA**, L. About 5 species in trop. Amer., one yielding the calabash fr. which is used for water-gourds.—High or low trees, glabrous: lvs. alternate, solitary or clustered at the nodes, simple: fls. yellowish with red or purple veins, large; calyx 2-parted or deeply 5-cut; corolla tubular, with a fluted 5-cut limb; stamens 4, didynamous, usually included; disk annular; ovary 1-celled with many ovules: fr. a hard-rinded berry with many wingless seeds surrounded by a pulp. (Crescen-tia: after Pietro de Crescenzi, 1230-1321, Italian agricultural writer.)

C. Cujete, L. CALABASH-TREE. Tree 20-40 ft. high, readily distinguished by its peculiar habit of growth, as it bears large wide-spreading horizontal scarcely divided branches with clusters of lvs. at intervals: lvs. broadly oblanceolate, 4-6 in. long, tapering to base: fls. solitary, pendulous; calyx 2-parted; corolla yellowish-purple, about 2 in. long, constricted below the middle, swollen above, the lobes cut, malodorous when decaying: fr. frequently 18-20 in. through, smooth, nearly globular. (Cujete: Brazilian name.) Trop. Amer., especially familiar in the W. Indies.

12. **KIGELIA**, DC. African trees of 10 species, one planted in warm regions.—Lvs. odd-pinnate: fls. orange or red, in loose long-stalked drooping panicles; calyx

campanulate, leathery, irregularly lobed; corolla with cylindric tube and 2-lipped limb, the lower lip deflexed and 3-lobed; stamens 4, didynamous; disk annular; ovary 1-celled, with numerous ovules: fr. hard, cylindrical, indehiscent. (Kige-lia: from a native name.)

K. pinnata, DC. SAUSAGE-TREE. To 50 ft.: lvs. ternate, of 7-9 oblong or obovate lfts. 3-6 in. long, toothed or entire, glabrous or somewhat pubescent beneath: fls. claret-colored, 3 in. and more long: fr. somewhat gourd-like, 1-1½ ft. long, hanging on cord-like stalks to several ft. long.

13. INCARVILLEA, Juss. Herbs suitable for border planting; species about a dozen in Turkestan, Tibet, China.—Sts. simple or somewhat branched, glabrous: lvs. alternate, simple or 2-3-pinnate, with narrow segms.: fls. large, red or yellow, in terminal clusters; calyx campanulate, 5-lobed; corolla-tube elongate, enlarging outward, limb somewhat 2-lipped, the 5 lobes broad and spreading; stamens 4, didynamous, included; disk ring-like; ovary 2-celled: fr. a caps. with many winged seeds. (Incarvil-lea: after Incarville, 1706-1757, French Jesuit missionary to China, correspondent of Jussieu.)

- A. Foliage cauline.
 - B. Lvs. 2-3-pinnate 1. *I. variabilis*
 - BB. Lvs. 1-pinnate 2. *I. Olgae*
- AA. Foliage basal.
 - B. Lfts. many, toothed 3. *I. Delavayi*
 - BB. Lfts. few, often entire, the terminal one much larger 4. *I. compacta*

1. *I. variabilis*, Batalin. Shrubby per. 1-2 ft. high, with leafy sts.: lvs. 2-4 in. long, 2-3-pinnate into small segms. which are entire or toothed: fls. rose-purple or pink, about 1½ in. long and 1 in. or more across, short-pedicelled, in loose racemes; calyx-lobes setiform, as long as tube: caps. 1 in. long. China.

2. *I. Olgae*, Regel. Shrubby per. to 3 ft. or more high, with leafy sts.: lvs. 1-pinnate into linear-oblong lfts. which are entire or coarsely toothed toward apex: fls. rose-purple to pale pink, 1-1½ in. long and ½-1 in. across, pedicelled, in panicles; calyx shortly 5-toothed, the lobes broader than long: caps. linear. (Named for Olga Fedtschenko, page 43.) Cent. Asia.

3. *I. Delavayi*, Bur. & Franch. Per.: lvs. few, radical, 1 ft. long, pinnately compound; lfts. 15-20, dentate, 4-5 in. long, not quite opposite: peduncle 1-2 ft. high, bearing 2-12 large trumpet-shaped fls. 2-3 in. long and as wide: corolla rose-purple with yellow tube, the 2 upper lobes of the limb smaller than the 3 lower; calyx-lobes triangular, much shorter than tube: caps. 2-3 in. long. (Named for the Abbé Delavay, who collected in China.) China.

4. *I. compacta*, Maxim. Per.: lvs. radical, pinnate into decurrent entire or somewhat toothed lfts., the terminal one nearly orbicular and much larger than lateral lfts.: peduncle 1 ft. high, bearing 1 to many rose-purple fls. 2-3 in. long and 2 in. wide; calyx-lobes triangular, shorter than tube. China. Var. *grandiflora*, Wehrhahn (*I. grandiflora*, Bur. & Franch.), has solitary long-stalked fls. Var. *brevipes*, Wehrhahn (*I. grandiflora* var. *brevipes*, Sprague), has short-stalked brilliant crimson fls.

14. CATALPA, Scop. Trees, frequently planted for ornament and also in timber plantations; about 10 species in N. Amer. and E. Asia.—Deciduous or rarely evergreen: lvs. opposite or sometimes whorled, long-petioled, large and simple, entire or coarsely lobed, emitting in most species a disagreeable odor when bruised: fls. white, pinkish, or yellowish, in large showy terminal panicles; calyx splitting irregularly or 2-lipped; corolla campanulate, 2-lipped, with 2 smaller upper and 3 larger lower lobes; fertile stamens 2, curved, with diverging anther-sacs, not exerted; style 2-lobed at apex, slightly longer than the stamens: fr. a very long cylindric caps. separating into 2 valves, with numerous small oblong compressed seeds bearing a tuft of white hairs at each end. (Catal-pa: Indian name for *C. bignonioides*.)

- A. Fls. yellow, inside striped orange and spotted dark violet, less than 1 in. long 1. *C. ovata*
- AA. Fls. white, with 2 yellow stripes inside, and spotted purplish-brown, 1½-2 in. long.
 - B. Lvs. pubescent beneath.
 - C. Apex of lvs. abruptly acuminate: panicles many-fl'd.
 - D. Diam. of fls. about 2 in. 2. *C. bignonioides*
 - DD. Diam. of fls. less than 2 in. 3. *C. hybrida*
 - CC. Apex of lvs. long-acuminate: panicles few-fl'd. 4. *C. speciosa*
 - BB. Lvs. glabrous beneath. 5. *C. Bungei*

1. *C. ovata*, Don (*C. Kaempferi*, Sieb. *C. Henryi*, Dode). Tree to 20-30 ft., with spreading head: lvs. broadly cordate-ovate, 5-10 in. long, abruptly acuminate, often 3-5-lobed and each lobe slender-pointed, finely pubescent with simple hairs or at length nearly glabrous, with reddish spots in the axils of the veins beneath: panicles many-fl., 4-10 in. long, fragrant; fls. yellow, not 1 in. long, inside striped orange and spotted dark violet: pod 12 in. long, $\frac{1}{2}$ in. diam. China; much cult. in Japan.

2. *C. bignonioides*, Walt. (*C. Catalpa*, Karst. *C. syriacæfolia*, Sims). COMMON CATALPA. INDIAN-BEAN. Tree 20-60 ft., with round spreading head: lvs. often whorled, broadly cordate-ovate, 5-8 in. long, abruptly acuminate, sometimes with 2 small lateral lobes, pubescent beneath, with an unpleasant odor: panicles broadly pyramidal, 8-10 in. long, many-fl.; fls. about 2 in. diam., white with 2 yellow stripes inside and thickly spotted purplish-brown: pod 6-15 in. long, $\frac{1}{2}$ in. diam. Ga. to Fla. and Miss.; nat. farther north. Var. *nana*, Bur. (*C. Bungei*, Hort.), is dwarf, usually grafted on upright boles forming standards with dense umbrella-like heads.—Pods, seeds, and bark said to possess medicinal properties.

3. *C. hybrida*, Spaeth (*C. bignonioides* \times *C. ovata*. *C. Teasii*, Penhall. *C. Teasiana*, Dode). HYBRID CATALPA. Large tree intermediate between the parents: lvs. resembling more those of *C. ovata* but much larger, pubescent beneath, purplish when unfolding: fls. resembling those of *C. bignonioides* but smaller and the infl. often twice as long. Originated at J. C. Teas nursery at Baysville, Ind.

4. *C. speciosa*, Warder. WESTERN CATALPA. To 100 ft.: lvs. inodorous, cordate-ovate, 6-12 in. long, long-acuminate, downy beneath: panicles comparatively few-fl., about 6 in. long and rather wider; fls. white, 2-2 $\frac{1}{2}$ in. diam., inconspicuously spotted inside, the lobes spreading and frilled at the margin: pod 8-18 in. long, $\frac{1}{2}$ - $\frac{3}{4}$ in. thick. S. Ill. to Ark.

5. *C. Bungei*, Mey. Small pyramidal tree: lvs. triangular-ovate, 3-6 in. long, long-acuminate, sometimes toothed or angled near base, glabrous: fls. white, 1 $\frac{1}{2}$ in. long, spotted with purple inside: caps. 10-14 in. long. (Named for Alexander von Bunge, page 40.) N. China.—The plant usually cult. under this name is *C. bignonioides* var. *nana*.

15. **CHILOPSIS**, Don. A single deciduous shrub or low tree native to S. W. U. S. and Mex., planted for its attractive bloom.—Lvs. narrow, often not opposite; corolla more trumpet-shaped than in Catalpa, the lobes jagged; anther-bearing stamens 4, a fifth rudimentary; ovary 2-celled: fr. cylindric, 2-valved, with many long-hairy seeds. (Chilop-sis: Greek *lip-like*.)

C. linearis, Sweet (*Bignonia linearis*, Cav. *C. saligna*, Don). DESERT-WILLOW. FLOWERING-WILLOW. Height 10-20 ft.; branches slender, leafy: lvs. narrow-lanceolate or linear, 6-12 in. long: fls. bignonia-like, in a short terminal raceme; corolla 1-2 in. long, 5-lobed and crimped, the tube and throat lilac, with 2 yellow stripes inside: pod 6-12 in. long and $\frac{1}{4}$ in. thick. Dry districts from S. Tex. to Calif. and in Mex.

16. **TABEBUIA**, Gomez. About 100 species of evergreen trees or shrubs native in trop. Amer., planted in warm regions.—Lvs. opposite, simple or digitately compound: fls. showy, in terminal panicles or racemes; calyx tubular, irregularly lobed; corolla funnellform, with spreading irregular limb; stamens 4, didynamous, included: fr. a linear loculicidally dehiscent caps. with many winged seeds. (Tabebuia: Brazilian name.)

A. Fls. yellow. 1. *T. argentea*
AA. Fls. white or pink. 2. *T. pentaphylla*

1. *T. argentea*, Britt. (*Tecoma argentea*, Bur. & Schum.). Tree to 25 ft.: lvs. of 5-7 oblong lfts. 2-6 in. long, densely silvery-scaly on both sides: fls. yellow, 2 $\frac{1}{2}$ in. long: caps. to 4 in. long, gray lined with black. Paraguay.

2. *T. pentaphylla*, Hemsl. (*Bignonia pentaphylla*, L. *Tecoma pentaphylla*, Juss. *Tabebuia pallida*, Miers). ROBLE BLANCO. Tree 20-60 ft. or more, somewhat scaly: lvs. of 3-5 long-petioled oblong or elliptic entire lfts. 3-6 in. long: fls. rose, pink or white, 2-4 in. long: caps. 8-10 in. long and $\frac{1}{4}$ - $\frac{1}{2}$ in. thick. W. Indies, Mex. to Venezuela.

17. **SPATHODEA**, Beauv. Handsome evergreen trees with large showy fls., grown out-of-doors in trop. and subtrop. regions or rarely in greenhouses; 2 or 3 species native of trop. Afr.—Lvs. large, opposite, odd-pinnate or sometimes ternate, with entire lfts.: fls. orange-red or scarlet, in terminal panicles or racemes; calyx split on one side and recurved, exposing the corolla to base; corolla broadly campanulate and ventricose; stamens 4, exserted, with spreading pendulous anthers; cells; disk large, cup-shaped; ovary oblong, 2-celled, the ovules in several rows: caps.

oblong-lanceolate, acuminate at both ends, loculicidal with woody valves; seeds elliptic, broadly winged. (Spathodea: Greek *spathe-like*, referring to the shape of the calyx.)

S. campanulata, Beauv. To 70 ft.: lvs. 1-1½ ft. long; lfts. 9-19, short-stalked, ovate-lanceolate or elliptic, 2-4 in. long, abruptly short-acuminate, with 2-3 fleshy glands at base, glabrous or somewhat pubescent beneath when young; fls. scarlet, about 4 in. long, in many-fld. racemes or panicles; calyx leathery, boat-shaped, 2½ in. long; corolla-lobes ovate, plicate, somewhat undulate; caps. flattened, 8 in. long, 2 in. through, glabrous. Trop. Afr.—A showy tree in the American tropics (where it is sometimes called "Santo Domingo Mahogany"), and somewhat planted within our limits.

18. JACARANDA, Juss. Trees and shrubs grown out-of-doors far S. and also under glass for the attractive finely cut foliage and showy tubular fls.; species about 50 in the American tropics.—Lvs. opposite, 2- or rarely 1-pinnate; lfts. usually numerous, small, entire or dentate; fls. blue or violet, mostly in terminal or axillary panicles; calyx small, truncate or 5-toothed; corolla-tube straight or curved, the limb somewhat 2-lipped, with 5 rounded spreading nearly equal lobes; disk thick and cushion-like; perfect stamens 4, didynamous, staminode about as long as the stamens, club-shaped and often bearded at the top; ovary 2-celled; fr. an oblong, ovate or broad dehiscent caps. with many winged seeds. (Jacaran-da: Brazilian name.)

A. Lvs. pubescent: fls. 2 in. long. 1. *J. acutifolia*
AA. Lvs. glabrous: fls. 1½ in. long. 2. *J. cuspidifolia*

1. **J. acutifolia**, Humb. & Bonpl. (*J. ovalifolia*, R. Br. *J. mimosifolia*, D. Don). Tree 50 ft. or more high, deciduous only in early spring, with foliage finely cut and fern-like: lvs. distant, each with 16 or more pairs of pinnae, each pinna having 14-24 pairs of oblong cuspidate pubescent pinnules, the terminal one long-acuminate: fls. blue, more or less horizontal, 2 in. long, 1½ in. wide, many, in loose pyramidal panicles 8 in. high; corolla-tube long, bent, swollen above, the 2 lobes of one lip smaller than the 3 other lobes: caps. orbicular, 2 in. across. Brazil.

2. **J. cuspidifolia**, Mart. Lvs. glabrous, with 8-10 pairs of lfts., these again divided into 10-15 lanceolate cuspidate pinnules, the secondary rachis winged: fls. in a large terminal thyse, blue-violet, the corolla nearly 1½ in. long. Brazil, Argentina.

19. STENOLOBIUM, D. Don. A few species of erect shrubs native Fla. to Mex. and S. Amer., one commonly planted in the S.—Lvs. odd-pinnate or simple, the lfts. toothed; fls. showy, in terminal racemes or panicles; calyx campanulate, 5-lobed; corolla funnelform or campanulate, tube contracted at base and hairy inside toward bottom; stamens 4, didynamous, included; ovary 2-celled with many ovules: fr. a linear caps. with thin-winged seeds. (Stenolo-bium: Greek for *small fruit*.)

A. Fls. pure yellow, funnelform-campanulate, abruptly contracted toward base: lfts. 5-13, acuminate. 1. *S. stans*
AA. Fls. yellow and red, tubular-funnelform, gradually narrowed toward base: lfts. 11-17, obtuse or acutish. 2. *S. alatum*

1. **S. stans**, Seem. (*Bignonia stans*, L. *Tecoma stans*, HBK.). **YELLOW-BELLS**. Shrub or small tree to 20 ft.: foliage glabrous or minutely pubescent; lvs. 4-8 in. long; lfts. 5-13, oblong-ovate to lanceolate, 1½-4 in. long, acuminate, sharply serrate, sessile or nearly so: fls. bright yellow, 1½-2 in. long, abruptly contracted toward base, the limb with undulate lobes; anthers pubescent; caps. 5-8 in. long and ¼ in. wide. S. Fla. to W. Indies and S. Amer.

2. **S. alatum**, Sprague (*Tecoma alata*, DC. *T. Smithii*, W. Wats.). Shrub or small tree: lfts. 11-17, oblong, 1-2 in. long, obtuse or acutish, serrate: fls. in large compound panicles sometimes 8 in. long and as broad; corolla bright yellow tinged with orange, 1½-2 in. long, tubular-funnelform, with 5 reflexed rounded lobes. Peru.

20. TECOMARIA, Spach. Three species in Afr., grown out-of-doors in warm regions for their showy fls.—Half-climbing or nearly upright evergreen shrubs with slender often sarmentose branches; lvs. opposite, odd-pinnate; lfts. serrate: fls. yellow, orange or scarlet, in dense terminal panicles or racemes; calyx campanulate, regularly 5-toothed; corolla funnelform, slightly curved, 2-lipped; stamens exerted, with pendulous diverging cells; disk cupulate; ovules 4 rows in each cell: caps. linear, compressed. (Tecoma-ria: name derived from *Tecoma*, alluding to its affinity.)

T. capensis, Spach (*Bignonia capensis*, Thunb. *Tecoma capensis*, Lindl.). CAPE-HONEYSUCKLE. Half-climbing shrub with branches 6 ft. or more long: lvs. petioled, 4-6 in. long; lfts. 5-9, broadly oval to ovate, $\frac{1}{2}$ -2 in. long, acute or acuminate, serrate, glabrous or woolly underneath in the axils of the veins: fls. in peduncled terminal racemes; corolla orange-red to scarlet, about 2 in. long, with 4-parted spreading limb, the upper lip emarginate: caps. 1-2 and more in. long and about $\frac{1}{8}$ in. wide. S. Afr.

Fig. 181. PEDALIACEÆ. A, *Ceratotheca triloba*: Aa, inflorescence, $\times \frac{1}{2}$, and leaf, $\times \frac{1}{4}$; Ab, ovary, cross-section, $\times 5$; Ac, ovary and calyx, vertical section, $\times 2$; Ad, flower, $\times \frac{1}{2}$; Ae, flower, vertical section, $\times \frac{1}{2}$; Af, capsule, $\times \frac{1}{2}$. B, *Sesamum indicum*: Ba, flower, $\times \frac{1}{2}$; Bb, capsule, $\times \frac{1}{2}$.

181. PEDALIACEÆ. PEDALIUM FAMILY

Herbs or rarely shrubs of trop. and subtrop. regions of Afr., Asia, Australia and E. Indies; genera 16 and species about 60.—Herbage covered with peculiar slime-secreting glands: lvs. opposite or the upper alternate: fls. bisexual, irregular; calyx 5-cleft; corolla gamopetalous, the tube more or less curved, the limb 5-lobed, markedly to indistinctly 2-lipped; stamens 4, didynamous, often with an entire staminode, subepipetalous; disk present, irregular; ovary superior or rarely inferior, 2-4-celled or falsely 1-celled: fr. a caps. or a hard indehiscent structure often covered with stiff hooked spines or wings.—Closely related to the Scrophulariaceæ and Martyniaceæ.

- A. caps. acuminate or obtuse at apex: fls. (ours) $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long. 1. SESAMUM
 AA. caps. truncate at apex, the angles divaricately awned or horned: fls. (ours) 2 $\frac{1}{2}$ -3 in. long. 2. CERATOTHECA

1. **SESAMUM**, L. Erect or prostrate herbs, suitable for the warmhouse or in the S. growing in the open; about 20 species of trop. and S. Afr. and E. Asia, one cult. for its seeds, sold under the name "bene" and yielding an oil which has various commercial uses.—Herbage scabrous or rarely glabrous: lowest lvs. opposite, the others alternate to subopposite, all petioled and entire or toothed or incised: fls. pale or violet, solitary in the axils; corolla-limb 2-lipped and 5-lobed; stamens included; ovary 2-celled, the nearly complete invagination of ovary wall causing it to appear as if 4-celled: caps. oblong or ovoid, acuminate or obtuse at apex. (Sesamum: Greek name taken by Hippocrates from the Arabic.)

S. indicum, L. (*S. orientale*, L.). SESAME. Height 1-3 ft.: lvs. variable, ovate to lanceolate, 3-5 in. long, the lower often 3-lobed or -parted: corolla pale rose or white, 1 in. long, the 2 lobes of the upper lip shorter than the 3 lobes of the lower: caps. about 1 in. long and $\frac{1}{8}$ in. wide, grooved, with short beak. Tropics.

2. **CERATOTHECA**, Endl. A trop. and S. African genus of about 5 species, closely allied to Sesamum, grown as a garden ann. or as a conservatory plant.—Per. or ann. hairy herbs, often viscid: lvs. petioled, simple or 3-lobed: fls. pink to lavender, in pairs in the axils; corolla-tube about thrice as long as limb, the latter 2-lipped and 5-lobed; stamens included; ovary 4-celled: caps. oblong, truncate at apex with awns or horns extending outward divaricately. (Ceratotheca: Greek for horned caps.)

C. triloba, E. Mey. Ann. to 5 ft., densely soft-pubescent to tomentose: lower lvs. broadly ovate to suborbicular, upper lvs. 3-lobed, coarsely crenate-dentate, to 5 in. long: fls. to 3 in. long, rose-lavender to pale violet, pubescent, pendent and in pairs, the lower lip much prolonged: caps. about 1 in. long. S. Afr.—Plant becoming bushy, grown readily from seed and should be sown early.

182. MARTYNIACEÆ. MARTYNIA FAMILY

Glandular-hairy herbs inhabiting trop. and sub trop. Amer., one species reaching S. Ind.; about 5 genera and 16 species.—Ann. or per., with lvs. opposite or alternate: fls. bisexual, irregular; calyx 5-cleft; corolla gamopetalous, 5-lobed; stamens 4, didynamous, or rarely 2 and the others staminodial, inserted on the corolla and alternating with its lobes; disk present, regular; ovary superior, of 2 carpels but 1-celled, placentation parietal, ovules several: fr. a more or less long curved beaked caps. with fleshy pericarp, becoming falsely 4-celled.—Closely related to the Pedaliaceæ but distinguished by the horned fr., 1-celled ovary, parietal placentæ, and less slimy pubescence.

A. Calyx of more or less connate sepals: infl. open, of 4-8 fls.: fr. viscid-tomentose....1. PROBOSCIDEA
 AA. Calyx of 5 free sepals: infl. dense, of few to many fls.: fr. echinate.....2. IBICELLA

Fig. 182. MARTYNIACEÆ. *Proboscidea Jussieu*: a, flowering branch, $\times \frac{1}{2}$; b, flower, side view, $\times \frac{1}{2}$; c, same, vertical section, $\times \frac{1}{2}$; d, anthers, face view, $\times 1\frac{1}{2}$; e, ovary, cross-section, $\times 6$; f, fruit, $\times \frac{1}{4}$.

1. PROBOSCIDEA, Keller. UNICORN-PLANT. Rank branchy plants sometimes grown for their odd showy fls., abundant foliage and peculiar pods; the young tender pods are used for pickles the same as cucumbers; 9 species, U. S. to S. Amer.—Coarse annuals or perennials, viscid-pubescent, mostly partially prostrate: lvs. large, hairy, long-petioled: fls. large, yellowish-purple, in axillary few-fl. racemes; calyx-lobes 5, more or less unequal; corolla campanulate to broad-funnelform, obscurely 2-lipped; stamens 4: fr. a curved beaked caps. becoming hard and woody, the beak splitting and forming 2 large opposed hook-like appendages when dry; seeds irregularly angled or flattened. (Proboscideæ: Greek *snout*, in allusion to the long-horned fr.)

P. Jussieu, Keller (*Martynia louisiana*, Mill. *M. Proboscidea*, Glox. *P. louisiana*, Woot. & Standl.). COMMON UNICORN-PLANT. PROBOSCIS-FLOWER. Densely clammy-pubescent ann., low and wide-spreading, with thick opposite divaricate branches to 3 ft. long: lvs. alternate or subopposite, soft and thick, round-ovate to oblong-ovate, 4-12 in. across, cordate and often unequal at base, wavy-margined, obtuse: racemes becoming central in the forks; fls. square-ended in bud; calyx bracteolate, unequally 5-lobed, slit to base on lower side; corolla creamy-white to light red or violet, 2 in. long, the limb unequally 5-lobed; stamens 4, in 2 pairs joined by their 2-celled anthers: fr. hanging, the thick body 4 in. long, the curved beak of equal or greater length. (Bears the name of de Jussieu, a French family with two brothers, Antoine and Bernard, 18th century botanists.) Ind. to N. Mex.—The trade names under Proboscidea and Martynia usually refer to this species. P. fragrans, Decne. (*M. fragrans*, Lindl.), differs in the mature lvs. being 5-lobed and fls. deep purplish.

2. IBICELLA, VanEseltine. Coarse viscid-pubescent ann. or per. herbs; 2 species in S. Amer.—Lvs. broad-ovate to suborbicular, entire, on rather stout semi-succulent sts.: fls. yellow, showy, in dense terminal infl.; calyx of 5 free sepals, the upper 3 linear-lanceolate to obovate, the lower 2 much broader; corolla obliquely campanulate, 5-lobed; fertile stamens 4 with staminodium usually present: fr. a long-beaked woody caps., the body cylindric-ovoid, echinate, slightly shorter than the slender horns. (Ibicel-la: Latin *little goat* or chamois, probably in allusion to horns of fr.)

I. lutea, VanEseltine (*Martynia lutea*, Lindl. *Proboscidea lutea*, Stapf). To $1\frac{1}{2}$ ft., coarsely bushy: lvs. to 1 ft. across, on petioles 4-8 in. long: fls. about 1 in. long, bright yellow, sometimes dotted red within, in dense usually many-fl. racemes; fr. 6-8 in. long. Brazil to Argentina,

Fig. 183. GESNERIACEÆ. A, *Sinningia speciosa*: Aa, plant in flower, $\times \frac{1}{6}$; Ab, flower, less perianth, $\times \frac{1}{2}$; B, *Kohleria hirsuta*: Ba, flower, $\times \frac{1}{2}$; Bb, same, vertical section, $\times \frac{1}{2}$; Bc, stamens, $\times 1$; Bd, glandular disk at top of ovary, $\times 1\frac{1}{2}$; Be, ovary, cross-section, $\times 3$. C, *Saintpaulia ionantha*: Ca, flower, $\times \frac{1}{2}$; Cb, same, vertical section, corolla partially excised, $\times 1\frac{1}{2}$; Cc, stamens, $\times 1\frac{1}{2}$.

183. GESNERIACEÆ. GESNERIA FAMILY

Herbs or rarely shrubs or small trees, widely distributed in the tropics of both hemispheres; about 100 genera and 800 species, a number cult. in N. Amer. for their showy fls.—Herbaceous forms with sts. rhizomatous, tuberous, or prostrate, the woody forms erect or climbing: lvs. opposite or sometimes alternate or whorled, simple: fls. bisexual; calyx tubular, 5-toothed or -parted; corolla commonly 5-merous, the tube mostly elongate, the limb of usually unequal segms., often 2-lipped; stamens epipetalous, usually 4 and didynamous, rarely 5, or 2 and the sterile present as staminodes; hypogynous disk present; ovary superior or inferior, of 2 carpels, 1-celled or falsely 2–4-celled, placentation parietal, ovules numerous; style 1; stigmas 1–2: fr. fleshy with pulpy placenta, or capsular or silique-like with twisted valves.

- A. Perfect stamens 2.
 - B. Corolla with tube much shorter than lobes. 1. SAINTPAULIA
 - BB. Corolla with cylindrical tube much longer than lobes. 2. STREPTOCARPUS
- AA. Perfect stamens 4–5.
 - B. Plant stemless, the fls. on naked scapes.
 - c. Corolla rotate, with very short tube. 3. RAMONDA
 - cc. Corolla with long tube.
 - d. Fls. about 1 in. long. 4. HABERLEA
 - DD. Fls. 3 in. or more long. 10. SINNINGIA
 - BB. Plant with evident sts.
 - c. Foliage leathery and glabrous (in ours). 5. ÆSCHYNANTHUS
 - cc. Foliage soft and hairy.
 - d. Anther-cells distinct.
 - e. Disk of 5 distinct glands; ovary partly inferior. 6. KOHLERIA
 - EE. Disk of 1 large posterior gland; ovary wholly superior. 7. EPISCIA
 - DD. Anther-cells confluent.
 - e. Fls. in a terminal leafless raceme. 8. SMITHIANTHA
 - EE. Fls. solitary or clustered in axils.
 - f. Corolla salverform; disk annular. 9. ACHIMENES
 - FF. Corolla campanulate; disk of 5 glands. 10. SINNINGIA

1. SAINTPAULIA, Wendl. Four herbaceous species grown in the greenhouse, native in trop. Afr.—Mostly acaulescent hairy perennials with long-petioled fleshy lvs. in a basal cluster and violet fls. in a loose few-flid. rather long-peduncled cyme: fls. 5-merous, zygomorphic; calyx deeply 5-parted; corolla-tube short, the limb 2-lipped, spreading, with elliptic lobes; stamens 2, the large yellow orbicular anther-cells confluent at apex, not parallel; staminodes 2; disk annular; ovary hairy: caps. oblong, loculicidally 2-valved. (Saintpaulia: from the discoverer of the plant, Baron Walter von Saint Paul-Illaire, 1860–1910.)

- A. Hairs of lf. of uniform length: caps. short, subglobose. 1. *S. ionantha*
- AA. Hairs of lf. of two types, uniformly long ones intermixed with uniformly short dense ones: caps. cylindrical. 2. *S. diplotricha*

1. *S. ionantha*, Wendl. (*S. kewensis*, Clarke). AFRICAN-VIOLET. Lvs. many, basal, orbicular to oblong-ovate, $1\frac{1}{2}$ –3 in. long, shallowly crenate to nearly entire, often pur-

plish beneath, densely and uniformly pilose; peduncles 1-4 in. long, 1-6-fld.; corolla to 1 in. across, lobes somewhat unequal; caps. short and subglobose, nearly $\frac{1}{2}$ in. long. Coastal region, E. Afr.—Many fancy-named color forms of this and the following are cult.

2. *S. diplotricha*, B. L. Burtt (*S. kewensis*, Hort. not Clarke). USAMBARA-VIOLET. Differs in lvs. densely short-pilose with longer hairs intermixed throughout; caps. cylindrical, about $\frac{1}{2}$ in. long. Usambara Mts., E. Afr.—A closely related species also cult. is *S. tongwensis*, B. L. Burtt, with elliptic bluntly acutish lvs. and very hairy cylindrical frs.; N. E. Tanganyika, E. Afr.

2. **STREPTOCARPUS**, Lindl. CAPE-PRIMROSE. Choice greenhouse herbs, grown for the showy bloom; about 60 species, natives of S. Afr. and Madagascar and 1 in Asia.—Plant stemless, with 1 or more spreading radical lvs. or rarely with a st. and opposite lvs.: fls. pale purple or blue, 1 or 2 or several, sometimes cymose, on scape-like or axillary peduncles; calyx small, divided into 5 linear segms.; corolla with long cylindric tube and 2-lipped limb, the 5 lobes somewhat unlike, rounded; perfect stamens 2, inserted high on the corolla-tube, the anther-cells confluent at apex, not parallel; disk short-annular; ovary superior, imperfectly 4-celled: caps. linear, splitting into 2, rarely 4 valves. (*Streptocar-pus*: Greek *twisted fruit*.)

S. kewensis, Hort. (*S. Rexii* \times *S. Dunnii*). Garden hybrid, acaulescent, with 2-3 large oblong or elongate-ovate bright green lvs.: fl.-sts. numerous, forming a rather compact mass, each stalk 6-8-fld.; corolla about 2 in. long, $1\frac{1}{4}$ - $1\frac{1}{2}$ in. across, bright mauve-purple, the throat striped with dark brownish-purple. The parent species *S. African*.

3. **RAMONDA**, Rich. (usually, but not originally, spelled *Ramondia*). Four species of small herbs native in the mts. of S. Eu. and adapted to the rock-garden.—Foliage in a basal rosette, hairy: fls. in few-fld. clusters at top of leafless scape; calyx deeply 4-5-parted; corolla rotate, with very short tube, 4-5-parted into obtuse nearly equal lobes; stamens 4-5, with very short filaments; ovary superior, with filiform style: caps. septicidally dehiscent into 2 valves, much exceeding the calyx. (Ramon-da: L. F. E. von Ramond de Carbonnières, 1753-1827, French botanist.)

A. Fls. 4-parted.....1. *R. Nathaliæ*
AA. Fls. 5-parted.....2. *R. Myconi*

1. *R. Nathaliæ*, Panc. & Petrov. (*R. serbica* var. *Nathaliæ*, Hort.). Lvs. oval, densely rusty-hairy particularly beneath, wavy-toothed, the petiole about equalling blade: fls. 4-parted, lavender-blue with golden center, $\frac{3}{4}$ in. across. (Named for Natalia Keijko, born 1859, daughter of a Russian officer.) Serbia, Bulgaria.

2. *R. Myconi*, F. Schultz (*Verbascum Myconi*, L. *R. pyrenaica*, Rich.). Lvs. ovate, 2-3 in. long, densely rusty-hairy, deeply toothed, the petiole short: fls. on scapes 3-6 in. high, 5-parted, purple or violet varying to white, with orange eye, $1-1\frac{1}{2}$ in. across. Pyrenees.

4. **HABERLEA**, Friv. Small per. herbs of a few species in the Balkans, grown in rock-gardens.—Lvs. forming a basal rosette, hairy: fls. nodding, in few-fld. clusters terminating the leafless scape; calyx deeply 5-parted; corolla with long tube and irregularly 5-lobed limb; stamens 4; ovary superior: caps. septicidally dehiscent into 2 valves, scarcely exceeding the calyx. (Haber-lea: named for K. K. Haberle, 1764-1832, botanist at Pesth.)

A. Lvs. hairy on both sides.....1. *H. rhodopensis*
AA. Lvs. glabrous above.....2. *H. Ferdinandi-Coburgii*

1. *H. rhodopensis*, Friv. Lvs. obovate- or ovate-oblong, 2-3 in. long, obtuse, long-attenuate at base, coarsely wavy-toothed, thick, hairy on both sides: fls. on somewhat hairy scapes 3-6 in. high, pale lilac, about 1 in. long and broad. From the Rhodope Mts. in the Balkans.

2. *H. Ferdinandi-Coburgii*, Urum. Differs from *H. rhodopensis* in lvs. glabrous above but hairy beneath, and the somewhat smaller fls. with shorter tube. (Named for Ferdinand of Saxe-Coburg, former king of Bulgaria.)

5. **ÆSCHYNANTHUS**, Jack (*Trichosporum*, D. Don, the older name but rejected by the International Rules). Woody plants often climbing on trees, cult. in the warmhouse for the attractive fls.; about 55 species, India, Malaya, and E. trop. Asia.—Free-flowering shrubs or subshrubs, glabrous or villous: lvs. opposite or occasionally in 3's or 4's, fleshy or leathery: fls. showy, solitary or clustered, axillary or at the tips of the shoots; calyx-tube long, the limb 5-toothed or -parted, usually

deciduous; corolla mostly with elongate somewhat curved tube and 2-lipped usually oblique limb; stamens 4, commonly exserted, the anther-cells parallel and distinct or nearly so; disk annular, often weakly 5-lobed; ovary superior, oblong or linear: caps. long-linear, 2-valved. (*Æschynanthus*: Greek for *ashamed* and *flower*.)

A. Corolla glabrous, three times longer than calyx. 1. *Æ. pulchra*
 AA. Corolla downy, not over twice as long as calyx. 2. *Æ. Lobbiana*

1. *Æ. pulchra*, Don (*T. pulchrum*, Blume). Plant trailing; lvs. short-petioled, broadly ovate, about 1 in. long, distantly small-toothed, fleshy, with sunken veins; fls. clustered, terminal, the fl.-stalk 2-fld., with 2 bracts; corolla glabrous, brilliant scarlet with yellow throat, $2\frac{1}{2}$ in. long, three times longer than the glabrous greenish calyx, the tube with globose base and slightly curved, the limb scarcely 2-lipped; stamens about equalling the upper corolla-lip. Java.

2. *Æ. Lobbiana*, Hook. (*T. Lobbianum*, Kuntze). Differs from the preceding in having narrower nearly entire lvs.; corolla downy, twice or less as long as the purple downy calyx. (Named for Thos. Lobb, a collector of this species.) Java.

6. **KOHLERIA**, Regel (*Isoloma*, Decne.). Species perhaps 50, in trop. Amer., suitable for greenhouse cult.—Herbs with creeping roots or rhizome or sometimes more or less woody: lvs. opposite, often villous: fls. scarlet, orange, or vari-colored, solitary or clustered in the axils or in a leafy terminal raceme; calyx obtusely 5-lobed; corolla-tube cylindric, ventricose or enlarged above, erect or more or less declined or incurved; corolla-limb short, with 5 subequal lobes; disk of 5 distinct glands; stamens inserted near the base of the corolla-tube, the anthers with distinct cells: caps. inferior to above the middle. (Kohle-ria: for Michael Kohler, lecturer at Zurich, 1834–1872.)—Most of the forms in cult. are probably of hybrid origin, the two species here described most nearly representing them, although other species may be grown.

A. Calyx-segms. triangular; corolla more than three times as long as calyx. 1. *K. amabilis*
 AA. Calyx-segms. linear-lanceolate; corolla three times as long as calyx. 2. *K. hirsuta*

1. *K. amabilis*, Fritsch (*I. amabile*, Mott. *Tydaea amabilis*, Planch. & Lind.). Hairy, 1–2 or more ft. high, with erect sts.: lvs. petioled, ovate, 2–5 in. long, bluntly dentate-serrate, acute or acuminate, dull green blotched and reticulated with purple along the main veins: fls. pendent, to 2 in. long; calyx green, the limb oblique, of 5 spreading triangular segms.; corolla-tube long, slightly curved, swollen, pale within and purple-blotched, the limb dark rose dotted with purple; fifth stamen rudimentary. Colombia.

2. *K. hirsuta*, Regel (*I. hirsutum*, Regel not Hort., which is probably a hybrid). Erect branching shrub, hairy, 4 ft. high: lvs. short-petioled, oblong-ovate, acuminate, rounded at base, crenate-serrate: fls. nodding, nearly 1 in. long, solitary, on axillary paired fl.-stalks; calyx 5-cleft into equal linear-lanceolate segms.; corolla three times as long as the calyx, the tube incurved, ventricose above, hairy outside, purple with spotted 5-cleft limb; stamens 4, inserted at the base of the corolla, included. Trinidad, Venezuela.

7. **EPISCIA**, Mart. Perhaps 30 species of trop. American plants, one much prized for hanging-baskets in the warmhouse.—Pubescent, villous or rarely glabrous herbs; sts. simple or branching, from a creeping root: lvs. opposite, of equal or unequal size: fls. scarlet or rarely whitish or purplish, solitary or fascicled, on axillary pedicels, or several on a common peduncle; calyx-limb 5-lobed or -parted; corolla-tube straight or curved, often spurred or swollen at base, the limb oblique or subequal, with 5 rounded lobes; stamens 4, distinct, inserted near the base of the corolla tube, the anther-cells distinct and parallel, a staminode representing the fifth stamen; disk with a large posterior gland, otherwise small or wanting; ovary superior: fr. dehiscing by 2 coriaceous valves. (*Epis-cia*: Greek *shady*, growing wild in shady places.)

E. *cupreata*, Hanst. (*Achimenes cupreata*, Hook.). Sts. slender, branched, rooting at the nodes, drooping, the main branch rising erect for a few in., and bearing the fls. and the largest lvs.: lvs. elliptic, oval or rotund-oval, about 2–3 in. long, blunt, crenate, rough-hairy, rugose above, often reddish-tinged or copper-colored: fls. scarlet, solitary, $\frac{3}{4}$ in. wide, the tube with a small sac, the limb denticulate. Nicaragua.—Growing throughout the year. A var. has green foliage and fls. 1 in. across.

8. **SMITHIANTHA**, Kuntze (*Nægelia*, Regel). Herbs grown in the warmhouse for their showy paniced fls., in cult. often called Gesnerias; species about a half

dozen in trop. Amer.—Usually rhizomatous or propagating by stolons or offsets and not by tubers; sts. subsimple: lvs. opposite, long-petioled, often cordate, soft: fls. showy, mostly red, sometimes yellowish-white or suffused, alternate in a terminal leafless cluster, the pedicels subtended by small bracts; calyx-tube adnate to the ovary, the limb with 5 subequal lobes; corolla-tube declined, narrow at base, broadening outward, the short limb with 5 rounded slightly unequal lobes; stamens inserted at the base of the corolla-tube, included; disk annular, entire or 5-lobed; ovary half inferior: caps. equally or obliquely 2-valved. (Smithiantha: named for Matilda Smith, 1854–1926, botanical artist at Kew.)

- A. Fls. scarlet or brick-red with white or yellow markings 1. *S. cinnabarina*
 B. Calyx-lobes spreading: fls. with white markings 2. *S. zebrina*
 BB. Calyx-lobes appressed: fls. with yellow markings 3. *S. multiflora*
 AA. Fls. white or cream-color 3. *S. multiflora*

1. *S. cinnabarina*, Kuntze (*N. cinnabarina*, Lind. *Gesneria cinnabarina*, Lind.). Winter-blooming, 1½–2 ft. high, soft-hairy: lvs. rotund-ovate, crenate-dentate, thickish, green, with red or purplish hairs: fls. about 1½ in. long, pendent from the ends of the spreading pedicels; calyx-lobes acuminate, spreading; corolla cinnabar-red or nearly scarlet on the upper side, paler and spotted beneath, the tube gibbous to the narrow base. Mex.

2. *S. zebrina*, Kuntze (*N. zebrina*, Regel. *Gesneria zebrina*, Paxt.). To 2 ft. high, densely pubescent, much resembling the preceding: lvs. ovate-subrotund, cordate or reniform, dark purple-red or dark brownish along the nerves on the upper surface: fls. red on the upper side, yellow with dark or red dots within and on the under side; calyx-lobes short and appressed; corolla 1½ in. long, contracted toward base. Brazil.—The commonest species. Names belonging here are *Gesneria regalis* and *G. splendens*.

3. *S. multiflora*, Fritsch (*Gloxinia multiflora*, Mart. & Galeotti. *N. multiflora*, Hook. *N. amabilis*, Decne. *S. amabilis*, Kuntze. *Gesneria amabilis*, Hort.). Erect, 1–1½ ft. high: lower lvs. broadly heart-shaped, petioled, crenate; st.-lvs. ovate-cordate, coarsely toothed, lightly hairy and glandular: fls. white or cream-color, pendulous, the corolla-tube curved and little swollen. Mex.—Much like *S. zebrina*.

9. **ACHIMENES**, P. Br. About 40 herbaceous species, native to trop. Amer., grown under glass.—Simple or branching, mostly villous, with scaly underground rhizomes: lvs. opposite or occasionally whorled, serrate or toothed, sometimes with scaly catkin-like vegetative growths in the axils: fls. solitary or fascicled in the axils; calyx-tube adnate to the ovary, the 5 lobes mostly small, subequal; corolla ranging from red to violet, seldom white, with cylindric declined tube and spreading 5-lobed limb; stamens 4, inserted at the lower part of the corolla-tube, included, the anthers connivent, a staminode representing the fifth stamen; disk annular, sometimes 5-angled or -lobed; ovary inferior; stigma dilated or 2-lobed: caps. 2-valved. (Achimenes: Greek to *suffer from cold*.)—The garden kinds are much confused by hybridization and it is doubtful whether any of the pure species are in general cult. in this country. The species here described are some of those that have contributed most largely to garden forms.

- A. Limb of corolla spreading, throat narrow.
 B. Fls. solitary in the axils; corolla-tube not swollen or spurred at base 1. *A. longiflora*
 BB. Fls. usually more than 1 in the axils; corolla-tube swollen or spurred at base 2. *A. grandiflora*
 AA. Limb of corolla recurved, throat wide open 3. *A. magnifica*

1. *A. longiflora*, DC. With root-like filiform rhizomes, producing pear-shaped tubers at their ends; sts. 1–2 ft. high, hairy: lvs. opposite or 3–4 in a whorl, oval or ovate-oblong, 1½–3 in. long, serrate, narrowed at base, acute or short-acuminate, hairy, pale or somewhat tinted beneath: fls. solitary in the axils; corolla salver-shaped, with long cylindric tube and large widely spreading limb violet-blue above and whitish beneath, the lowest segm. sometimes divided. Guatemala.—A var. has white fls.

2. *A. grandiflora*, DC. Stiffly hairy: lvs. ovate, pointed, unequal at base, irregularly toothed, often reddish beneath: fls. large, numerous, often more than 1 in the axils, bright red-purple; corolla-tube swollen or spurred at base. Mex.

3. *A. magnifica*, Voss. Lvs. oblong, pointed, toothed, soft-hairy on both sides, reddish on veins beneath: fls. solitary, 2 in. across, dark scarlet-red marked with dark purple; corolla with recurved limb and wide open throat. Colombia.

10. **SINNINGIA**, Nees. Trop. herbs suitable for glasshouse cult., including the florists' gloxinia; species 20–25, Brazil.—Low herbs or sometimes almost woody,

pubescent or villous, with simple or branching sts. from a tuberous rhizome, or sometimes almost stemless: lvs. opposite, usually large, long-petioled, the upper floral ones reduced to bracts: fls. mostly large, solitary or fascicled in the axils, on short or long pedicels; calyx-tube shortly and broadly turbinate, 5-angled or 5-winged, the limb 5-cleft or -parted; corolla-tube subequal at base, gibbous posteriorly, elongate, broadly cylindric, or widened above or campanulate; corolla-limb with 5 broad subequal lobes; stamens inserted at the base of the corolla, included, the anther-cells confluent at apex; glands of the disk 5, distinct or the 2 posterior more crowded together or connate; ovary half inferior: caps. 2-valved above. (Sinningia: for Wilhelm Sinning, gardener at the University of Bonn.)

S. speciosa, Benth. & Hook. (*Gloxinia speciosa*, Lodd.). **GLOXINIA**. Sts. short or not evident: lvs. petiolate, oblong or oblong-ovate, 6 in. or more long, crenate, obtuse or acutish, villous-hairy: peduncles with fls. about the length of the lvs.; fls. 3 in. or more long, showy, usually violet or purplish; calyx-lobes ovate-lanceolate, longer than the tube, somewhat villous; corolla broadly campanulate, the limb with 5 short rounded lobes.—This is the cult. gloxinia, other species being little known horticulturally. Variable, giving rise to forms with thick elongated sts. and larger lvs., or with white-nerved lvs. or with white or red fls.

Fig. 184. **GLOBULARIACEÆ**. *Globularia Aphyllanthes*: a, flowering plant, $\times 10$; b, flower, $\times 4$; c, flower, perianth expanded, $\times 4$; d, pistil, $\times 6$; e, ovary, vertical section, $\times 10$; f, anther, $\times 10$.

184. **GLOBULARIACEÆ**. **GLOBULARIA** FAMILY

About two dozen herbs and shrubs in 3 genera, from the Cape Verde Isls. to Socotra, known chiefly in the Medit. region, yielding plants for ornament.—The shrubs are usually heath-like, the herbs low and mostly caespitose or repent: fls. small, in *Globularia* in dense globular bracted or involucrate heads; corolla 2-lipped, the upper lip short and 2-lobed, the lower 3-lobed; calyx 5-toothed or -lobed; stamens 2 or 4, attached in the tube, exserted; ovary 1, superior, 2-celled or 1-celled by abortion, with a single terminal style, and 1 hanging ovule in each cell: fr. a little indehiscent nutlet included in the calyx.

GLOBULARIA, L. **GLOBE-DAISY**. About 22 herbs or little subshrubs in S. Eu. and S. W. Asia, mostly in mountainous regions, with characters of the family; adapted to rock-gardens, fls. usually blue. (*Globularia*: fls. in globular heads.)

- A. Plant not stoloniferous.
 - B. Scapes with conspicuous leafy bracts.
 - c. Lvs. obtuse: bracts short-pointed.....1. *G. Aphyllanthes*
 - cc. Lvs. acute: bracts long-aristate.....2. *G. vulgaris*
 - BB. Scapes with inconspicuous or no bracts.....3. *G. nudicaulis*
 - AA. Plant producing stolons.
 - B. Scape with leafy bracts.....4. *G. trichosantha*
 - BB. Scape with very small or no bracts.
 - c. Lvs. obovate to nearly orbicular, retuse.....5. *G. cordifolia*
 - cc. Lvs. lanceolate to obovate-lanceolate, short-acuminate, rarely retuse.
 - d. Heads long-peduncled: lvs. 1-4 in. long.....6. *G. meridionalis*
 - DD. Heads nearly sessile: lvs. to $\frac{3}{4}$ in. long.....7. *G. repens*
1. *G. Aphyllanthes*, Crantz (*G. vulgaris*, Lam. *G. Willkommii*, Nym.). Lvs. in a rosette, spatulate to ovate, 2-5 in. and more long, long-petioled, obtuse, entire or emarginate, sometimes 3-toothed at apex but middle tooth much shorter than side teeth: heads on scapes 10-12 in. high, with leafy short-pointed bracts. (*Aphyllanthes*: st. with few small upper lvs.) S. Eu.

2. *G. vulgaris*, L. Probably not in cult., the plant grown under this name being *G. Aphyllanthus*: differs from that species in more woody base, acute lvs. with sharp teeth of equal size, long-aristate bracts and involucrel lvs., and shorter calyx-lobes. S. E. Eu.

3. *G. nudicaulis*, L. Lvs. in a rosette, oblong, to 8 in. long, long-attenuate into petiole, obtuse or somewhat acute: heads $\frac{3}{4}$ –1 in. across, on scapes longer than the lvs. which are naked or with 1 or 2 very small bracts. S. Eu.

4. *G. trichosantha*, Fisch. & Mey. Stoloniferous, densely tufted: lvs. in rosettes, spatulate-oval, the blade 1 in. or less long, attenuate into short petiole, apex usually 3-toothed, the middle tooth shorter than side teeth: heads about $\frac{1}{2}$ in. across, on scapes to 8 in. high, with linear-lanceolate long-acuminate bracts. Asia Minor.

5. *G. cordifolia*, L. Small procumbent subshrub about 4 in. high, stoloniferous: lvs. in rosettes, obovate to nearly orbicular, to 1 in. long, attenuate at base, retuse, emarginate or somewhat 3-toothed at apex: heads about $\frac{1}{2}$ in. across, on naked scapes. S. Eu.

6. *G. meridionalis*, Schwarz (*G. bellidifolia*, Ten.). Distinguished from *G. cordifolia* by the narrower lanceolate to obovate-lanceolate short-acuminate lvs. 1–4 in. long: heads long-peduncled. S. Eu.

7. *G. repens*, Lam. (*G. nana*, Lam.). Small prostrate densely tufted per. with woody sts., stoloniferous: lvs. lanceolate or obovate-lanceolate, $\frac{1}{8}$ – $\frac{3}{4}$ in. long, short-acuminate: heads to $\frac{1}{2}$ in. across, usually nearly sessile. Mts. of Spain and S. France.

Fig. 185. ACANTHACEÆ. A, *Beloperone guttata*: Aa, flowering branch, $\times \frac{1}{2}$; Ab, flower, $\times \frac{1}{2}$; Ac, anther, $\times 2$. B, *Acanthus montanus*: Ba, inflorescence with leaf, $\times \frac{1}{2}$; Bb, flower with bract, $\times 1$; Bc, same, vertical section, $\times 1$; Bd, stamen, $\times 2$. C, *Thunbergia alata*: Ca, flower, $\times \frac{1}{2}$; Cb, same, vertical section (corolla-limb excised), $\times 1$; Cc, ovary, vertical section, $\times 3$; Cd, stigma, $\times 4$; Ce, stamen, $\times 3$.

185. ACANTHACEÆ. ACANTHUS FAMILY

Over 2,000 species, in 200 genera, mostly in the tropics around the world, but some extending into temp. regions; they yield many plants for ornament, particularly under glass.—A difficult family for the beginner, as the characters of separation are technical, some of the best of them residing in the anthers and the pollen-grains: it is known specially by the convolute or imbricate aestivation of the corolla which is usually irregular or 2-lipped, stamens 2 or else 4 in 2 pairs, ovary superior, fr. capsular and 2-celled and usually dehiscent elastically, lvs. opposite, simple and exstipular: herbs or shrubs bearing bisexual fls., often with a tube and limb 5-lobed or -toothed, infl. prevailingly spicate or glomerate and prominently bracted; style 1 and mostly long and very slender (often long-exserted) and commonly remaining after the corolla has fallen, stigmas 1 or 2, ovules 1 to many in a cell, placentation axile; stamens inserted on the corolla, and sometimes a staminode present; seeds borne on little hooks with the exception of the *Thunbergia* tribe (amongst ours).

A. Perfect stamens 4.

B. Limb of corolla split to make a single 3-5-lobed lip.

c. Tube of corolla very short; calyx 4-parted.

cc. Tube of corolla long; calyx 5-parted.

BB. Limb of corolla 2-lipped or nearly regular.

c. Corolla strongly 2-lipped.

cc. Corolla 5-lobed, not distinctly 2-lipped.

1. ACANTHUS
2. CROSSANDRA
3. APHELANDRA

- D. Ovules 3-10 in each cell. 4. RUELLIA
 DD. Ovules 2 in each cell.
 E. Bracts (at least in ours) shorter than calyx.
 F. Plant (ours) herbaceous or only suffrutescent.
 G. Sts. procumbent or clambering. 5. ASYSTASIA
 GG. Sts. erect. 4. RUELLIA
 FF. Plant (ours) an upright shrub 2-4 ft. high 6. STROBILANTHES
 EE. Bracts longer than calyx.
 F. Calyx truncate or with many small teeth. 7. THUNBERGIA
 FF. Calyx 4-parted to base. 8. BARLERIA
 AA. Perfect stamens 2.
 B. Corolla not 2-lipped although perhaps not regular, lobes expanding flat or nearly so.
 C. Bracts large and conspicuous.
 D. Limb of corolla (in ours) small, forming a revolute rim; stamens long-exserted. 9. SANCHEZIA
 DD. Limb of corolla large and spreading; stamens not or only slightly exserted. 10. ERANTHEMUM
 CC. Bracts small and inconspicuous.
 D. Lobes of corolla small, $\frac{1}{4}$ in. or less long.
 E. Fls. bright red (in ours), cylindrical. 11. ODONTONEMA
 EE. Fls. blue, violet or white, campanulate. 6. STROBILANTHES
 DD. Lobes of corolla prominent, $\frac{1}{2}$ in. or more long.
 E. Tube of corolla abruptly enlarged from slender base. 12. MACKAYA
 EE. Tube of corolla not abruptly enlarged. 13. PSEUDERANTHEMUM
 BB. Corolla strongly 2-lipped, lobes very unequal.
 C. Anther-cells alike and equal.
 D. Staminodes 2, small; bracts shorter than calyx. 14. GRAPTOPHYLLUM
 DD. Staminodes 0: bracts covering the calyx. 15. FITTONIA
 CC. Anther-cells unlike in shape, size or position, one often above the other.
 D. Stamens attached at base of corolla-tube. 16. PACHYSTACHYS
 DD. Stamens attached in throat of corolla or near middle of tube.
 E. Anthers blunt.
 F. Attachment of stamens in throat of corolla. 17. PERISTROPHE
 FF. Attachment of stamens near middle of corolla-tube. 18. JACOBINIA
 EE. Anthers pointed or spurred.
 F. Connective (separating the anther-cells) narrow and little noticeable: floral bracts, in ours, not conspicuous. 19. JUSTICIA
 FF. Connective broad, so that anther-cells are much separated: bracts, in ours, broad and showy. 20. BELOPERONE

1. **ACANTHUS**, L. BEARS-BREECH. A score or more of per. herbs or small shrubs in the Medit. region, Asia and Afr., a few planted for ornament.—The cult. kinds are thistle-like, with stately simple sts. and mostly radical lvs., the showy fls. in long heavy erect spikes: lvs. mostly sinuate-dentate to pinnatifid, the teeth often ending in spines: fls. subtended by a large foliaceous more or less colored spiny bract, and by 2 narrow often spine-tipped lateral bractlets; calyx 4-parted, 2 lobes very large and 1 of them often spine-toothed, the 2 interior ones very small and scale-like; corolla with a very short tube from one side of which extends a single large 3-5-lobed expanded lip; stamens 4, attached at throat of tube, the filaments very thick and prominent, the anthers yoked and white-woolly on dehiscence; ovules 2 in each cell, the style shortly 2-lobed: caps. oblong or ovoid, scarcely contracted at base, 4-seeded. (Acanthus: Greek *thorn*.)

- A. Lvs. spiny-toothed. 1. *A. montanus*
 AA. Lvs. not spiny, sinuate-lobed. 2. *A. mollis*

1. **A. montanus**, T. Anders. Subshrubby, sts. nearly or quite glabrous, to 3 ft.: lvs. long-oblong, 1 ft. or more long, pinnatifid, those on the st. more or less ovate and 4-8 in. long and dentate, all of them spinose on the margins, scabrous and more or less hairy on veins beneath: fls. rose-tinted and prominently veined, about 2 in. long, in a terminal spike to 10 in. long on a leafy st. W. Afr.

2. **A. mollis**, L. Sts. strict and straight, to 2 ft., pubescent above: lvs. oblong to oblong-ovate, more or less cordate, 1-2 ft. long and half as broad on mature plants, sinuate-lobed or -pinnatifid, sometimes with lobes separate at base of blade, without spines: fls. whitish, rose or lilac, in spikes $1\frac{1}{2}$ ft. long. S. Eu. Var. *latifolius*, Vilm. (*A. latifolius*, Goeze), is a larger-lvd., bigger and more robust form.

2. **CROSSANDRA**, Salisb. Shrubs and herbs with showy fls. in thick four-sided spikes; species probably 20 and more, in the Old World tropics; choice plants under glass.—Glabrous for the most part, erect: lvs. sometimes whorled, entire or toothed: fls. white, yellow, orange-red, sessile in dense axillary and terminal bracted spikes with imbricate bracts and linear bractlets; calyx 5-lobed, strongly irregular; corolla

slender-tubed, the limb usually split to the throat so as to make a single 5-lobed lip; perfect stamens 4, didynamous, inserted in upper part of tube; ovules 2 in each cell; style shortly 2-lobed: caps. oblong, more or less 4-angled, seeds normally 4. (Crossandra: Greek *fringed anthers*.)

C. infundibuliformis, Nees (*Justicia infundibuliformis*, L. *C. undulæfolia*, Salisb.). Shrub, 1-3 ft., pubescent toward the top: lvs. narrow-ovate to lanceolate, 3-5 in. long, narrowed to petiole, acuminate, more or less undulate, puberulent or glabrous: fls. scarlet-orange, in dense pubescent sessile or stalked spikes, the slender tube $\frac{3}{4}$ in. long, the one-sided limb about 1 in. across; bract about as long as the caps.; seeds bearing feather-like scales. India.

3. APHELANDRA, R. Br. Herbs and shrubs of trop. Amer., producing spikes of showy bloom for which they are grown under glass; species 70 or 80.—Lvs. usually many and ample, often showy, entire or toothed: fls. sessile in dense simple or branched axillary and terminal spikes, with large often colored imbricating bracts; corolla yellow, orange, red, strongly 2-lipped, upper lip ascending and lower one usually outspreading or declined or rolled; perfect stamens 4, attached in base of the mostly cylindrical corolla-tube, the 1-celled anthers equal and pointed; ovules usually 4 in each cell; style entire: caps. oblong, little if at all contracted at base, the seeds normally 4. (Aphelandra: Greek *simple anther*.)

A. Side lobes of lower lip similar to central lobe.

B. Fls. pale yellow: lvs. white-veined. 1. *A. squarrosa*

BB. Fls. orange: lvs. green. 2. *A. aurantiaca*

AA. Side lobes very small: fls. scarlet. 3. *A. tetragona*

1. *A. squarrosa*, Nees, var. *Leopoldii*, Van Houtte. Robust glabrous more or less succulent plant: lvs. crowded, ovate to ovate-elliptic, 8-12 in. long, acuminate, entire, pale green beneath but dark green above and in the cult. plant with white rib and veins: fls. pale yellow, $1\frac{1}{2}$ in. long, somewhat exserted, lobes of lip oblong, the densely imbricated bracts orange-yellow; spikes terminal, solitary or in 3's. Brazil.

2. *A. aurantiaca*, Lindl. (*Hemisandra aurantiaca*, Scheidweiler). Plant of medium size and stature, glabrous: lvs. ovate-elliptic or oblong, 4-6 in. long, acuminate, entire, more or less undulate, strongly veined, light green beneath and deep green above: fls. orange sometimes tinged scarlet, the lower lip with large oval-pointed declined lobes; bracts serrate. Mex. to S. Amer.

3. *A. tetragona*, Nees (*Justicia tetragona*, Vahl). Shrub with nearly or quite glabrous branches: lvs. large, elliptic to elliptic-ovate, 4-9 in. long, tapering to petiole, acuminate, entire, green, lightly hairy beneath: fls. long and narrow, the tube 2 in. long, scarlet, upper lip hooded, lower with 1 long narrow lobe and 2 very small lateral lobes, in clustered four-sided spikes; bracts obtuse, pubescent. W. Indies, N. S. Amer.

4. RUELLIA, L. Herbs and small shrubs of wide distribution in trop. countries and some in temp. regions, a few grown under glass and in the open in mild climates for the showy bloom and sometimes ornamental foliage; species upwards of 200, largely American.—Plants usually pubescent, the lvs. prevailinglly entire and the pairs equal: fls. white to rose, violet, purple, yellow, variously disposed in clusters or panicles or sometimes solitary; calyx deeply cleft or parted, with the parts linear or narrow; corolla with a short or long tube but narrow and slender and the upper part more or less enlarging, the 5 lobes spreading and nearly or quite equal; perfect stamens 4, the filaments dilated and more or less paired or connected at base; ovules 2-10 in each cell; style slender, mostly recurved at apex and simple or 2-lobed: caps. oblong or clavate, mostly stipitate, 6-20-seeded. (Ruellia: Jean de la Ruelle, 1474-1537, French physician and botanist.)

A. Foliage purple, often veined with white.

B. Fls. white marked with lilac. 1. *R. Devosiana*

BB. Fls. bright carmine. 2. *R. Makoyana*

AA. Foliage green.

B. Fls. 3 in. and more long and broad. 3. *R. macrantha*

BB. Fls. 1-2 in. long.

C. Corolla red, gibbous at base. 4. *R. græcizans*

CC. Corolla blue or lavender, with slender tube, not gibbous.

D. Lvs. linear or linear-lanceolate, long-attenuate, nearly glabrous. 5. *R. Brittoniana*

DD. Lvs. oblong or obovate, obtuse, hairy. 6. *R. citiosa*

1. *R. Devosiana*, Morr. Shrubby with more or less decumbent base and erect branches, 1- $1\frac{1}{2}$ ft., sts. pubescent: lvs. elliptic, $1\frac{1}{2}$ -2 in. long, short-acute, slender-petioled, entire,

velvety, purple beneath, white-ribbed and -veined above: fls. solitary and sessile, about $1\frac{3}{4}$ in. long, white with lilac throat and lines, tube slender but widening above, lobe nearly $\frac{1}{2}$ in. long and emarginate. (Dedicated to A. Devos of the Univ. of Liege.) Brazil.—Grown for foliage.

2. *R. Makoyana*, Hort. Differs from *R. Devosiana* in the bright crimson fls. (Intro. to cult. by Jacob-Makoy et Cie of Liege.) Brazil.

3. *R. macrantha*, Mart. Shrub to 6 ft., with nearly glabrous angular branches constricted above the ciliate nodes: lvs. ovate-lanceolate, 4–6 in. long, tapering both ways, essentially entire, with small scattered hairs: fls. axillary and contiguous, rosy-purple with prominent veins, 3 in. or more long and about the same in breadth, the lower half of corolla-tube slender and cylindrical but the upper part much expanded, the 5 lobes rounded and spreading. Brazil.

4. *R. græcizans*, Backer (*R. amana*, Nees. *R. longifolia*, Griseb. not Rich. *Stephanophysum longifolium*, Pohl). Subshrub, 1–2 ft., usually herbaceous as grown in pots, twigs glabrous or puberulent: lvs. ovate to oblong-lanceolate, 2–5 in. long, somewhat narrowed into short petiole, acuminate, serrate to repand, more or less finely puberulent: fls. several on long axillary peduncles that branch as they grow, bright red, about 1 in. long, gibbous, the corolla-tube suddenly expanding just above the linear-lobed calyx, the 5-lobed limb short. S. Amer.

5. *R. Brittoniana*, Leonard. Somewhat woody, 1–3 ft. high, nearly glabrous: lvs. linear-oblong to linear, 3–12 in. long and $\frac{1}{4}$ – $\frac{3}{4}$ in. wide, long-attenuate, entire or slightly undulate: fls. in a leafy corymbiform infl., blue-violet, 1–1 $\frac{1}{2}$ in. long, lower part of tube cylindrical, expanded above, the limb with broad rounded lobes. (Named for N. L. Britton, page 40.) Mex.; escaped Tex. to Fla.—Usually grown under the name *R. malacosperma*, Greenman, which differs in being somewhat hairy when young, lvs. oblong or elliptic-lanceolate and shorter and mostly toothed and undulate, and calyx-segms. about twice longer. Mex.

6. *R. ciliosa*, Pursh. Very hairy, often rosulate, main sts. 2–12 in. long: lvs. oblong or obovate, 1–4 in. long and $\frac{1}{2}$ –1 in. wide, obtuse, sometimes undulate: fls. usually solitary and axillary, bluish to lavender, 1–2 in. long, with long slender tube and expanded limb. S. C. to Fla. and La.

5. **ASYSTASIA**, Blume. Herbs or shrubs of over 30 species in tropics of Old World, one grown as a ground-cover.—Lvs. entire or somewhat toothed: fls. in terminal racemes or panicles; bracts and bracteoles small; calyx parted to base; corolla with cylindrical tube enlarged in upper half and 5 nearly equal lobes; stamens 4, inserted below the throat, anther-cells oblong, parallel; ovules 2 in each cell: caps. oblong, 4-seeded above. (Asystasia: name of doubtful application.)

A. gangetica, T. Anders. (*Justicia gangetica*, L. *A. coromandeliana*, Nees). Per. with procumbent or clambering branches 1–4 ft. long, somewhat pubescent: lvs. ovate, 1–4 in. long, acute: fls. purple to yellowish or white, in one-sided racemes 4–6 in. long; corolla to $1\frac{1}{2}$ in. long and 1 in. across the limb: caps. 1 in. long, pubescent. Malaya to Afr.; nat. in W. Indies.

6. **STROBILANTHES**, Blume. Species probably 200, herbs and small shrubs, mostly in the warm parts of Asia, cult. for ornamental bloom or foliage, under glass in the N. and in the open in warm regions.—Lvs. of the pairs sometimes much unlike, entire or toothed: fls. blue, violet, white, less frequently yellowish, solitary in axils or in spikes and panicles; calyx deeply cleft or parted, with narrow segms.; corolla with a narrow or constricted base but much broader above, the 5-lobed limb spreading and more or less unequal but not bilabiate; perfect stamens 4 and didynamous, or sometimes 2 and others represented by staminodes, the filaments more or less connected at base; ovules 2 in each cell; style slender and recurved, mostly evidently 2-lobed at apex: caps. bearing 4 seeds (or fewer by abortion), oblong or linear, scarcely contracted at base. (Strobilanthes: Greek *cone-flower*, from the infl. of some species.)

A. Grown for the bloom: lvs. small and narrow, taper-based, green.....1. *S. isophyllus*
A. Grown for foliage: lvs. large, cordate, iridescent.....2. *S. Dyerianus*

1. *S. isophyllus*, T. Anders. (*Goldfussia isophylla*, Nees). Nearly glabrous branchy shrub, 2–3 ft., with angled twigs: lvs. of the pairs equal (as the name indicates), narrow-lanceolate, willow-like, 2–4 in. long, contracted to short petiole, very long-acuminate, bluntly serrulate, veiny: fls. several on axillary peduncles shorter than the lvs., about 1 in. long, bluish-pink or blue and white, the short blunt corolla-lobes emarginate. India.

2. *S. Dyerianus*, Mast. Branching shrub grown in hothouses for the foliage which is rose-purple beneath and variegated above in iridescent tints of blue and lilac: lvs. elliptic-

lanceolate or lance-ovate, 6-8 in. long, contracted or fiddle-shaped toward base, sessile, cordate at attachment, serrulate: fls. $1\frac{1}{2}$ in. long, in erect spikes, pale violet, the corolla-tube curved, the 5 short broad lobes revolute. (W. T. Thiselton-Dyer, page 42.) Burma.

7. THUNBERGIA, Retz. **CLOCK-VINE**. Trop. plants, most of them climbers, woody or herbaceous, several grown under glass or in the open in S. U. S. for the showy fls.; about 75 species, mostly African and Asian.—Lvs. opposite, simple, prevailing hastate at base: fls. solitary in the axils or racemose, yellow, white, blue, purple, subtended by 2 large more or less foliaceous bracts; calyx various, either truncate or 10-15-toothed; corolla large, funnelform or somewhat bell-shaped, the tube curved or straight, limb 5-lobed and nearly regular or at least not distinctly bilabiate: stamens 4, didynamous, attached near base of the tube; ovules 2 in each cell: caps. seed-bearing at base, produced into a beak. (Thunbergia: Carl Peter, or Carl Pehr, Thunberg, Swede, 1743-1822, was a student of Linnæus and a successor, traveller in Japan and S. Afr., of which he wrote floras; sometimes written Karl Peter.)

- A. Plant an erect shrub: fls. solitary, blue with yellow center. 1. *T. erecta*
- AA. Plant twining.
 - B. Petiole winged.
 - c. Corolla-lobes strongly emarginate. 2. *T. Gibsonii*
 - cc. Corolla-lobes essentially truncate or obtuse. 3. *T. alata*
 - BB. Petiole not winged.
 - c. Lvs. large and thick, 5-8 in. long, coarsely notched, cordate or subcordate. 4. *T. grandiflora*
 - cc. Lvs. medium or small, nearly or quite entire, not cordate.
 - d. Fls. in terminal or axillary racemes.
 - e. Corolla blue, limb expanded. 5. *T. laurifolia*
 - EE. Corolla scarlet, limb short and reflexed. 6. *T. coccinea*
 - DD. Fls. solitary in axils. 7. *T. fragrans*

1. *T. erecta*, T. Anders. (*Mayenia erecta*, Benth.). Much-branched glabrous erect shrub, 2-8 ft., the branches flexuose: lvs. ovate, 1-3 in. long, short-petioled, acute, margins entire or obscurely repand-toothed or -angled: fls. solitary on axillary pedicels, $1\frac{1}{2}$ - $2\frac{3}{4}$ in. long, limb blue-purple, the curved tube yellowish-white; calyx very short, with 10 or more small teeth, hidden by the bracts: caps. 1 in. long, with large flat beak. Trop. Afr.—In cult. varies to white and blue fls.

2. *T. Gibsonii*, S. Moore. Per. herb but readily grown as an ann., twining 4-5 ft., the sts. hairy: lvs. short-ovate or nearly triangular-ovate, 2-3 in. long, subcordate or cordate-sagittate at base, obtuse or only very short-acute at apex, sinuate-toothed, pubescent both surfaces, the petiole $1\frac{1}{2}$ -2 in. long with the wing, expanding upward: fls. solitary on very long axillary hairy peduncles, the corolla orange, $1\frac{1}{2}$ in. or more across, the lobes broad and emarginate; calyx small, many-lobed; bracts ovate, half or more as long as the corolla-tube, strongly veined and rust-colored. Trop. Afr., at high elevations; first collected at the equator in 1892 by Mr. Gibson.

3. *T. alata*, Bojer. **BLACK-EYED SUSAN**. Herbaceous per. twiner but often grown as an ann. with slender hairy sts.: lvs. ovate to triangular-ovate, 1-3 in. long, the base cordate and more or less hastate, obtuse or acutish and usually apiculate, margins repand-toothed, pubescent both surfaces, the long petiole winged: fls. solitary on long axillary pedicels, about $1\frac{1}{2}$ in. long, limb buff or cream-color and throat dark purple, the 5 segms. rounded; calyx very small, beneath the 2 green bracts that nearly equal the corolla-tube: caps. about 1 in. long, with a globular base and flat beak. Trop. Afr., but now nat. widely in tropics.—Runs into races without the dark eye, also white and other colors.

4. *T. grandiflora*, Roxb. Extensive woody twiner with sts. nearly or quite glabrous: lvs. thick, large, 5-8 in. long, ovate to broad-ovate, 3-nerved from base, cordate or subcordate, acuminate-pointed, angle-toothed or slightly lobed or some of them entire, scabrous or pubescent both surfaces, petiole not winged: fls. in stout dense hanging racemes or sometimes solitary, large and showy, about 3 in. across, light or dark blue or white, the expanded limb almost 2-lipped with 3 lobes beneath and 2 above; calyx reduced to a rim; bracts large, nearly equalling broad corolla-tube. Bengal; now widespread in trop. countries.

5. *T. laurifolia*, Lindl. (*T. Harrisii*, Hook. f.). Sometimes confused with no. 4, but separated by its narrow not lobed or toothed lvs., which are lanceolate to lance-ovate, 3-5 in. long, rounded or tapering at base, mostly long-acuminate, margins sometimes obscurely repand but not dentate, not scabrous and scarcely pubescent beneath: fls. light blue with whitish or yellowish throat, 3 in. across, in racemes, the large rounded lobes not very unequal. India.

6. *T. coccinea*, Wall. (*Hexacentris coccinea*, Nees). Tall glabrous woody twiner with 4-angled branchlets: lvs. lance-ovate to broad-ovate, 3-5 in. long, subcordate or hastate at base, acuminate-pointed, 3-5-nerved from base, upper margins entire or somewhat sinuate-

dentate: fls. in pendulous mostly large terminal and axillary racemes, the corolla with a scarlet lobed reflexed limb and yellow throat, $\frac{3}{4}$ – $\frac{1}{2}$ in. across; calyx very small and indistinctly toothed, this and corolla-tube covered by the large spathe-like bracts. India.

7. *T. fragrans*, Roxb. Slender somewhat woody glabrous twiner: lvs. lanceolate to triangular-ovate, 2–3 in. long, broadened or subcordate and with 1 or 2 angle-teeth at base, apex acute, margins entire or somewhat repand, slender-petioled, lightly scabrous: fls. solitary and axillary, white, fragrant, the spreading limb $1\frac{1}{2}$ –2 in. across, the lobes toothed at apex; calyx small, many-toothed; bracts acute, shorter than the cylindrical tube: caps. about $\frac{3}{4}$ in. long, with flat beak. India.

8. *BARLERIA*, L. Shrubs and herbs of more than 100 species, nearly all in the Old World tropics, a few sometimes grown under glass for the showy fls. and planted out in warm countries.—Glabrous or pubescent, erect, sometimes spiny: lvs. entire: fls. showy (in the cult. kinds), white, blue or yellow, solitary or fascicled in the axils, sometimes in terminal spikes, accompanied by large often spinose bracts; calyx 4-parted, the 2 outer ones large, the lateral interior ones small and narrow; corolla-tube mostly long, the lower part slender and upper part broad, the 5 spreading broad lobes mostly subequal; perfect stamens 4 and didynamous, attached near base of corolla; ovules 2 in each cell, the style mostly entire: caps. ovoid or oblong, bearing normally 4 seeds. (*Barleria*: Jacques Barrelier, 1606–1673, French botanical collector and author.)

B. cristata, L. Little shrub, 2–3 ft., branches yellowish-pubescent, sts. not spiny: lvs. elliptic, 1–3½ in. long, tapering to short petiole, short-acute, scabrous-puberulent: fls. blue, nearly or quite sessile in the axils, corolla about 2 in. long; bracts elliptic, $\frac{3}{4}$ in. long, strongly nerved and light green or whitish, with long spiny teeth; corolla-lobes obtuse. India.

9. *SANCHEZIA*, Ruiz & Pav. About a dozen strong erect large herbs and shrubs of S. Amer., one grown in the warmhouse in the N. for the ornamental foliage and showy spikes.—Lvs. large, strongly pinnate-veined, entire or somewhat toothed: fls. large and showy, orange, red, or purple, with large calyx-like bracts, in terminal and axillary spikes or in some species solitary; corolla-tube long, cylindrical below and enlarging upward, the 5 lobes short and broad; perfect stamens 2, attached below middle of tube, with 2 staminodia between them, the 2 anther-cells mucronate; ovules 4 in each cell; style very slender, obscurely 2-lobed at apex: caps. scarcely contracted at base, the seeds normally 8. (*Sanchezia*: Jos. Sanchez, early professor of botany at Cadiz.)

S. nobilis, Hook. f. Shrub 3–4 ft., with strong upright branches, sts. glabrous except perhaps in infl.: lvs. oblong-ovate, 4–12 in. long, short-petioled, tapering at base, abruptly acuminate, sinuate-dentate to nearly entire: fls. 2 in. long, the corolla yellow, with revolute rim; bracts 1–1½ in. long, red. Ecuador.—There are named cultivars with variegated lvs.

10. *ERANTHEMUM*, L. (*Dædalacanthus*, T. Anders.). About a score of shrubs and herbs, native in trop. Asia, one a common ornamental under glass and in the open in warm countries.—Lvs. entire or perhaps somewhat dentate: fls. blue or rose-colored, in close bracted often panicle spikes; calyx 5-lobed or -parted, covered by the bracts; corolla with long very slender often curved tube, the limb spreading and 5-lobed, not 2-lipped; perfect stamens 2, attached in throat of corolla: caps. ovoid or oblong, with 4 seeds or perhaps fewer by abortion. (*Eranthemum*: Greek *lovely flower*.)

E. nervosum, R. Br. (*Justicia nervosa*, Vahl). Shrub 2–4 ft., nearly or quite glabrous: lvs. ovate to elliptic, 4–8 in. long, rather thick, prominently pinnate-veined, tapering to mostly long petiole, acuminate, margins obscurely crenate-dentate: fls. in axillary and terminal spikes, with appressed very acute prominently nervose bracts; corolla blue, the tube $\frac{3}{4}$ –1 in. long and curved, limb about $\frac{3}{4}$ in. across. India.—Early known as *Eranthemum pulchellum*, and yet sometimes cult. under that name.

11. *ODONTONEMA*, Nees (*Thyrsacanthus*, Nees). About 20 shrubs and herbs in trop. Amer., several more or less grown for ornament, one apparently now frequent on our southern borders and southward.—Lvs. usually large and entire: fls. commonly many in terminal spicate racemes in the axils of small and inconspicuous

bracts; corolla with slender straight or slightly curved tube that much exceeds the narrow-lobed calyx, the tube somewhat widened toward the top; corolla-limb essentially regular (in ours) or somewhat 2-lipped, the upper lip entire or 2-toothed and the lower 3-lobed; stamens 2, attached in upper part of tube, with dorsifixed anthers of which the 2 cells are equal or nearly so and not spurred; staminodia 2 and small; ovules 2 in each cell. (Odontone-ma: Greek combination referring to toothed filaments.)

O. strictum, Kuntze (*T. strictus*, Nees). Nearly or quite glabrous erect shrub, 5-6 ft.: lvs. oblong-ovate to oblong-lanceolate, 3-6 in. long, acuminate, very short-petioled, entire but often undulate, more or less short-hairy on veins beneath: fls. bright crimson, $\frac{3}{4}$ -1 in. long, straight, in erect simple close racemes, the limb regular or practically so and the little obtuse lobes about $\frac{1}{2}$ in. long. Forests of Cent. Amer.—Sometimes grown as *Jacobinia coccinea*.

12. MACKAYA, Harvey. As now accepted, a genus of 4 shrubs, 1 in Afr. and 3 in India, the former in frequent cult. under glass and in the open in S. Calif. and elsewhere.—Corolla somewhat curved, much broadened in the upper half, the 5 prominent lobes subequal; perfect stamens 2, and 2 long filiform staminodes, the anthers muticous and equal; ovules 2 in each cell; stigma 2-lobed; floral bracts very small: caps. stipitate. (Macka-ya: James T. Mackay, about 1775-1862, Irish botanist.)

M. bella, Harvey (*Asystasia bella*, Benth. & Hook.). Nearly or quite glabrous, 3-4 ft.: lvs. oblong to ovate-oblong, 3-5 in. long, tapering below to short petiole, gradually or abruptly pointed, the margins variously sinuate-dentate: fls. several in terminal racemes, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long and as much across, lavender and veined; calyx small, with linear-subulate lobes. S. Afr.

13. PSEUDERANTHEMUM, Radlk. (*Eranthemum*, Auth. not L.). Species 60-70 or more in many trop. countries, a few small shrubs grown under glass for the attractive bloom and often colored foliage.—Herbaceous or woody, erect, glabrous: lvs. entire or coarsely toothed: fls. white, blue, purple, red, often more or less marked with yellow, 1-3 in the axils of linear bracts and arranged in spikes, cymes or racemes; calyx with 5 narrow lobes; corolla with long or short tube, the 5 spreading lobes nearly equal or the 2 posterior ones smaller; perfect stamens 2, attached in the tube, staminodes 2; ovules 2 in each cell; style filiform, apex entire or 2-toothed: caps. oblong, stipitate, seeds 4 unless aborted. (*Pseuderan-themum*: false *eranthemum*.)

A. Tube of corolla very slender, about 1 in. or more long.....1. *P. bicolor*

AA. Tube not slender, $\frac{1}{2}$ in. or less long.

B. Lvs. broad-ovate, usually marked wine-red.....2. *P. atropurpureum*

BB. Lvs. ovate-lanceolate to lanceolate, usually veined yellow.....3. *P. reticulatum*

1. **P. bicolor**, Radlk. (*Eranthemum bicolor*, Schrank). Shrub, 2-3 ft., sts. glabrous: lvs. narrow- or long-ovate, 4-8 in. long, tapering to short petiole, very long-acuminate, dark green, entire, glabrous: fls. sessile in clusters on elongating axillary and terminal unbranched spikes, salverform, white with lower lobes spotted purple, corolla-tube cylindrical and very slender, 1- about $1\frac{1}{2}$ in. long, the 5 spreading lobes oval and obtuse, the expanded corolla 1 in. or somewhat more across; calyx-lobes acute but not subulate. Probably Polynesia.

2. **P. atropurpureum**, Radlk. (*Eranthemum atropurpureum*, Bull not Hook. f.). Glabrous shrub, 3-4 ft.: lvs. broad-ovate to oval, 3-6 in. long and usually about two-thirds as broad, rounded or slightly tapering at base and short-petioled, apex broad and obtuse but usually with a little point, entire, wine-purple or pink-purple and variously blotched (but sometimes green and sometimes spotted yellow): fls. short-pedicelled and clustered on axillary and terminal spikes, white with rose-purple center and spots but sometimes entirely purplish, the tube rather stout and about $\frac{1}{2}$ in. long, the 5 obtuse lobes spreading to $\frac{3}{4}$ -1 in. across. Probably Polynesia; frequent in American tropics as a cult. and spontaneous plant.

3. **P. reticulatum**, Radlk. (*Eranthemum reticulatum*, Bull). Shrub, 2-3 ft., with angled glabrous branchlets: lvs. ovate-lanceolate, 5-10 in. long, mostly abrupt or rounded at base, the petiole short, long-tapering but apex obtuse, entire but undulate, dark green with golden veins: fls. short-pedicelled in axillary and terminal panicles, white with wine-purple throat and spots on one lobe, the rather thick tube about $\frac{1}{2}$ in. long, the 5 oblong obtuse spreading lobes about $1\frac{1}{2}$ in. across; calyx-lobes linear-subulate. Probably Polynesia.

14. **GRAPTOPHYLLUM**, Nees. Trop. shrubs of Australia and Polynesia, 4 or 5 species, one widely grown in warm regions for the handsome foliage.—Glabrous, with entire or dentate lvs. which are often colored and variegated: fls. pedicelled, red or purple, in short nearly sessile cymes or panicles, the bracts and bractlets very small and not covering the linear-lobed calyx; corolla with curved tube, 2-lipped, the upper lip 2-lobed and lower 3-lobed; perfect stamens 2, staminodia 2 and small, anthers 2-celled and sharp-pointed below; ovules 2 in each cell; style somewhat 2-toothed: caps. contracted into stalk. (Graptophyllum: Greek *to write, leaf*, from the pictured foliage.)

G. pictum, Griff. (*Justicia picta*, L. *G. hortense*, Nees). Erect, to 8 ft.: lvs. elliptic, 4–6 in. long, more or less tapering to short petiole, acuminate or short-acute, entire, purplish or green, variously marked and splotted yellow: fls. dark purple or crimson, about 1½ in. long, some of them yawning and strongly 2-lipped with side lobes of lower lip turned down; stamens ascending and prominent. Probably New Guinea.

15. **FITTONIA**, Coem. Low or creeping herbs, 2 or 3 reputed species, probably forms of one, grown under cover for the handsome foliage, native in S. Amer., probably in Peru.—Sts. very hairy: lvs. broad, entire, with colored veins on upper surface: fls. pale or yellowish, small and not ornamental, underneath broad obtuse or short-acute scales in long slender spikes; calyx deeply cut, the lobes equal or one of them larger; corolla with a slender tube, deeply 2-lipped; stamens inserted at middle of tube, the anthers not pointed; ovules 2 in each cell; style filiform, with 2-notched stigma: caps. ovate, long-stipitate. (Fittonia: dedicated to Elizabeth and Sarah Mary Fitton, authors of “Conversations on Botany,” which appeared in London in the early part of 19th century.)

A. Sts. creeping and rooting, herbaceous: lvs. obtuse.....1. *F. Verschaffeltii*
AA. Sts. erect or ascending, becoming somewhat woody: lvs. with very short point.....2. *F. gigantea*

1. **F. Verschaffeltii**, Coem. Low creeping and rooting herb with shaggy-hairy sts.: lvs. oval to nearly ovate, 3–4 in. long, rounded or subcordate at base, mostly rounded at apex, dark green with deep red veins and midrib. (Bears the name of Ambroise Verschaffelt, 1825–1886, Belgian horticulturist.) Var. **Pearcei**, Nichols., has veins and midrib bright carmine and under surface somewhat glaucous. Var. **argyoneura**, Nichols. (*F. argyoneura*, Coem.), has lvs. bright light green with veins and rib white.

2. **F. gigantea**, Lind. Erect and branching, 12–18 in., becoming somewhat shrubby: lvs. with a very short point, veins and rib carmine.

16. **PACHYSTACHYS**, Nees. About a half dozen trop. American plants, sometimes referred to Jacobinia, but differing in technical characters of pollen, and otherwise distinguished by the attachment of the stamens in the base of the corolla-tube: fls. yellow or purple, 1–3 in the axil of large bracts in thick head-like thyrses (whence the name Pachys-tachys: Greek *thick spike*.)

P. coccinea, Nees (*Justicia coccinea*, Aubl. *Jacobinia coccinea*, Hiern.). CARDINALS GUARD. Strong glabrous shrub, 5–7 ft., the thick sts. constricted above the joints: lvs. ovate or elliptic, to ovate-lanceolate in the small ones, 5–8 in. long, rather short-acuminate, entire, strongly pinnate-veined: fls. scarlet, in dense terminal heads; corolla about 2 in. long, lipped nearly or quite to the middle, upper lip somewhat arched, the lower one reflexed; bracts large, ovate-pointed, entire. Trinidad, N. S. Amer.

17. **PERISTROPHE**, Nees. Old World trop. herbs and subshrubs, grown under glass for the free showy bloom; species about 15.—Erect or partially creeping: lvs. entire: fls. solitary or in clusters surrounded by involucre-like bracts mostly longer than the deeply 5-lobed calyx; corolla rose or purple, with slender tube slightly enlarged above, the limb in 2 nearly equal parts and widely expanded, upper lip nearly entire and lower one 3-toothed or -lobed; stamens 2, attached in throat of corolla, the anthers blunt; calyx 5-lobed into equal segms., subtended by calyculate bractlets: caps. ellipsoid, stalked, 4-seeded. (Peristrophe: Greek *belled around*, referring to the involucre.)

A. Lvs. lanceolate: ann.....1. *P. salicifolia*
AA. Lvs. essentially ovate: woody per.....2. *P. speciosa*

1. **P. salicifolia**, Miq. (*Justicia salicifolia*, Blume. *P. angustifolia*, Nees). Perhaps ann., grown as such, low, diffuse but erect, much-branched, glabrous except near tips: lvs. lanceo-

late, 2-3 in. long, tapering both ways; fls. few in terminal cymes, light red; involucre of 2 ovate-oblong unequal ciliate bracts. Java.—Grown for the yellow-variegated foliage of the cult. race.

2. *P. speciosa*, Nees. Erect spreading glabrous plant becoming woody at base, 2-3 ft., sts. constricted above the nodes; lvs. ovate, lance-ovate or elliptic, 4-5 in. long, acuminate, entire; fls. violet-purple, 2 or 3 together on slender branches or peduncles, subtended by 2 bract-like lvs.; corolla $1\frac{3}{4}$ -2 in. across and nearly or quite as long, the 2 stamens exerted over the lower lip; bractlets narrow, widening upward. India.

18. **JACOBINIA**, Moric. (incl. *Cyrtanthera*, Nees). Herbs and shrubs of the American tropics, 20-40 species, distinguished from *Justicia* by the absence of spur-like points on anthers: stamens usually attached about the middle of corolla-tube, staminodia often represented by 2 hairy elevations, and dissimilarities in pollen-grains. (Jacobin-ia: probably a personal name.)

- A. Infl. a dense head-like thyrses or spike, often with broad floral bracts.
 B. Floral bracts acute.
 c. Color of fls. yellow 1. *J. umbrosa*
 cc. Color of fls. purplish or red.
 d. Fls. rose-purple or flesh-colored 2. *J. carnea*
 dd. Fls. crimson 3. *J. Pohlana*
 BB. Floral bracts (at least above the base) obtuse.
 c. Plant glabrous 4. *J. obtusior*
 cc. Plant velutinous 5. *J. velutina*
 AA. Infl. open, racemose, paniculate, or fls. solitary, bracts not prominent. (LIBONIA, Koch. SERICOGRAPHIS, Nees.)
 B. Corolla deeply bilabiate, the lower lip coiled or deflexed.
 c. Calyx-lobes triangular- or ovate-acute 6. *J. Ghiesbreghtiana*
 cc. Calyx-lobes linear and long-acute 7. *J. spicigera*
 BB. Corolla shortly bilabiate, lower lip not reflexed or coiled.
 c. Length of corolla about 1 in. or less: lvs. essentially obtuse 8. *J. pauciflora*
 cc. Length of corolla $1\frac{1}{4}$ in. or more: lvs. acute 9. *J. penrhosiensis*
1. *J. umbrosa*, Blake (*Justicia aurea*, Schlecht. *Justicia umbrosa*, Benth. *Jacobinia aurea*, Hemsl. not Hiern). Shrub, 4-12 ft., with thick more or less angled puberulent sts.: lvs. lanceolate-oblong or ovate, 6-12 in. long, rounded or very broad at base, acuminate, entire or sinuate, mostly puberulent beneath; fls. yellow, in dense terminal spike-like thyrses to 1 ft. long; corolla pubescent, about 2 in. long, lipped to the middle; bracts narrow and acute, $\frac{1}{2}$ - $\frac{3}{4}$ in. long. Mex., Cent. Amer.
2. *J. carnea*, Nichols. (*Justicia carnea*, Hook. *Cyrtanthera magnifica*, Pohl. *Jacobinia magnifica*, Lindau). Stout forking pubescent shrub, 2-5 ft., with short internodes: lvs. ovate or oblong, 6-7 in. long, tapering at base, acuminate, entire or crenulate; fls. rose-purple or flesh-colored, in dense terminal heads about 4 in. long with oblong acuminate bracts $\frac{3}{4}$ in. long; corolla about 2 in. long, viscid-pubescent, lipped to the middle or below, the lower lip broad. Brazil.—Confused in cult. with *J. obtusior*.
3. *J. Pohlana*, Lindau (*Cyrtanthera Pohlana*, Nees). More robust and leafy than no. 2 and less pubescent, even nearly glabrous: lvs. ovate-oblong or ovate, acuminate, often purple-tinged; fls. bright crimson, in a long or oblong spike; bracts ovate-acute. Brazil (where it was early collected by J. E. Pohl).
4. *J. obtusior*, Bailey (*Cyrtanthera Pohlana* var. *obtusior*, Nees). Plant glabrous: lvs. lanceolate to lance-ovate, long-acuminate; infl. short and compact, the floral bracts very obtuse or perhaps the outer involucre ones somewhat acute; fls. pink to crimson. Brazil.
5. *J. velutina*, Voss (*Cyrtanthera Pohlana* var. *velutina*, Nees). Similar to *J. obtusior* but lvs. velutinous on both sides: fls. rose, hairy. Brazil.
6. *J. Ghiesbreghtiana*, Hemsl. (*Justicia Ghiesbreghtiana*, Lem.). Glabrous or lightly pubescent shrub to 5 ft., nodes somewhat enlarged, much-branched: lvs. lance-ovate to narrow-elliptic, 3-6 in. long, tapering both ways, short-petioled, entire, arching; fls. mostly 2 together and sessile in forking axillary peduncled open little panicles with small bracts not larger than the calyx; corolla orange to crimson, mostly upwards of $1\frac{1}{2}$ in. long, lipped about one-third distance from apex, about $\frac{1}{4}$ in. broad at widest part, the rather broad lower lip deflexed and becoming coiled; calyx with broad but acute lobes about $\frac{1}{8}$ in. long. Mex., intro. from the collections of Ghiesbreght.
7. *J. spicigera*, Bailey (*Justicia spicigera*, Schlecht. *Justicia atramentaria*, Benth. *Justicia Mohinii*, Moc. & Sessé). Fls. more slender than in no. 6, orange-yellow to purplish, lvs. smaller and narrower; calyx-lobes longer, linear-acute to nearly subulate: shrub to 10 ft. Mex.
8. *J. pauciflora*, Lindau (*Sericographis pauciflora*, Nees. *Libonia floribunda*, Koch). Little shrub, 1-2 ft., with terete pubescent sts.: lvs. small, unequal in the pairs, oblong to oval to obovate, $\frac{3}{4}$ in. or less long or the upper ones larger, obtuse, entire, very short-petioled; fls. solitary on short axillary peduncles, mostly nodding, about $\frac{3}{4}$ in. long, scarlet with the upper one-fourth yellow, the lips less than $\frac{1}{4}$ in. deep. Brazil.

9. *J. penrhosiensis*, Bailey (*Libonia penrhosiensis*, Lav. *Sericobonia ignea*, Lind. & André). Recorded as a hybrid between *J. pauciflora* and *J. Ghiesbreghtiana*: in character much like the former but lvs. mostly larger and in equal pairs, tapering-acute at apex: fls. $1\frac{1}{4}$ in. or somewhat more long, bright carmine-red with yellow only about the opening, the lips $\frac{1}{4}$ in. or more deep.—Some of the plants passing as *J. pauciflora* belong here.

19. **JUSTICIA**, L. Herbs and shrubs of widespread trop. distribution, 250–300 species if the genus is defined broadly, 100 or more species if taken in a restricted sense; few are cult., the ornamental plants grown under this name being mostly Jacobinias.—Calyx deeply 5-parted (only seldom 4-parted), the lobes usually about equal: fls. small or large, white, violet or red, solitary, racemose, spicate or fascicled, sometimes with prominent imbricated bracts; corolla straight or curved, 2-lipped, tube short and mostly dilated above, upper lip erect or ascending and entire or 2-toothed, lower one spreading and 3-lobed; stamens 2 and staminodia none, attached in the throat and exserted or prominent, the anthers unequal in height and one of them produced below into a spur or evident point; stigma capitate or 2-toothed: caps. ovate or oblong, with 2 or 4 seeds. (Justic-ia: James Justice, Scotch gardener, author of "British Gardener's Director," 1754.)

J. secunda, Vahl. RED JUSTICIA. Shrub to 8 ft., puberulous above: lvs. ovate-oblong to lance-ovate, to 6 in. long, somewhat tapering to petiole, very long-acuminate, entire or obscurely crenate: fls. in a terminal narrow elongating panicle, red, $1\frac{1}{2}$ in. long, narrow, lips longer than tube; calyx-lobes sharp, much shorter than corolla-tube; bracts smaller than calyx. N. S. Amer.

20. **BELOPERONE**, Nees. Trop. American shrubs or subshrubs of some 30 species, one planted in the open and also an attractive pot-plant under glass.—From *Justicia* the genus is distinguished by the broad connective or upper part of filament, whereby the 2 anther-cells are considerably separated so that the edges are not at all contiguous; anther-cells mostly unlike, one standing higher than the other, one or both of them sharp-pointed or spurred on the lower end: fls. 2-lipped, and much as in *Jacobinia*, the lower lip 3-lobed: caps. long-stalked, the floral bracts often large and imbricate. (Beloper-one: Greek, from the arrow-shaped anthers.)

B. guttata, Brandegee. SHRIMP-PLANT. Much-branched from base, 12–20 in., the terete sts. short-hirsute: lvs. ovate, 1–2½ in. long, short-acuminate, abruptly tapering to slender petiole, entire, short-hirsute both surfaces: fls. in curving-erect strobile-like spikes 2½–3½ in. long borne beneath ornamental overlapping reddish-brown broad-ovate pubescent bracts ½–¾ in. long; corolla slender and exserted beyond the bracts, 1½ in. long, divided nearly to the middle into narrow lips, white and pubescent but lower lip with 3 rows of purplish spots in throat; upper lip entire; lower lip somewhat declined but not recurved, a little longer and broader than the upper and with 3 shallow close obtuse lobes; calyx about one-fourth as long as corolla-tube, whitish, 5-cleft and regular; stamens 2, ascending under the upper lip but not exserted, the lower anther-cell more pointed at base; style filiform and slightly exserted, the stigma small and entire; ovules 2 in each cell. Mex.

Fig. 186. MYOPORACEÆ. A, *Bonita daphnoides*: Aa, fruiting branch, $\times \frac{1}{4}$; Ab, flower, $\times 1\frac{1}{2}$. B, *Myoporum laetum*: Ba, flowering branch, $\times \frac{1}{4}$; Bb, flower, $\times 3$; Bc, same, perianth expanded, $\times 3$. (Ab redrawn from Engler and Prantl, Bb–Bc adapted from Skottsberg.)

186. MYOPORACEÆ. MYOPORUM FAMILY

Woody plants, mainly natives of Australia but also represented by scattered species in the W. Indies, Japan, China, Hawaiian Isls. and elsewhere; genera 5 and

species about 90.—Shrubs or trees, glandular or woolly: lvs. alternate or rarely opposite, simple, entire or rarely toothed: fls. bisexual, regular or irregular, axillary, solitary or fascicled, subsessile or pedicellate; calyx 5-parted or -cleft, persistent; corolla gamopetalous, the limb 5-6-lobed, sometimes bilabiate; stamens 4, didynamous, the fifth represented by a staminode, epipetalous; ovary superior, 2-celled or falsely 3-10-celled; ovules usually 1-2, rarely 8 in a cell; style 1, stigmas 1-2: fr. drupaceous.—Related to the Scrophulariaceæ and the Verbenaceæ, the distinctive characters being the presence of oil-glands, the few ovules and the pendulous seeds.

A. Corolla regular or obscurely irregular, predominatingly white.....1. MYOPORUM
AA. Corolla deeply 2-lipped, prevailing yellow.....2. BONTIA

1. **MYOPORUM**, Banks. More or less heath-like shrubs (or sometimes trees), a few grown in a cool greenhouse; species 25-30, Australia, New Zeal., China, Japan, Pacific isls.—Lvs. alternate, rarely opposite, entire or toothed, with pellucid glands: fls. axillary, usually clustered, small or medium-sized, mostly white; calyx 5-toothed or -parted; corolla regular or nearly so, the tube short and campanulate or longer and funnellform; stamens 4, didynamous, seldom 5; ovary 2-10-celled, each cell 1-2-seeded: fr. a small more or less succulent drupe. (Myop-orum: Greek, referring to the translucent resinous dots on the lvs.)

A. Corolla white or deep pink.....1. *M. acuminatum*
AA. Corolla white spotted purple.....2. *M. lætum*

1. ***M. acuminatum***, R. Br. Variable shrub, erect and glabrous: lvs. alternate, elliptic-oblong to lanceolate or linear, to 3 in. long, entire or very few-toothed, somewhat acuminate: fls. in small clusters or solitary, white, the corolla subcampanulate, about $\frac{1}{2}$ in. long, bearded within, the lobes shorter than the tube: drupe almost globular, $\frac{1}{4}$ in. or less in diam. Australia.

2. ***M. lætum***, Forst. f. Shrub or small tree to 25 ft.: lvs. lanceolate or obovate-lanceolate, 2-4 in. long, finely serrate above the middle, acute or acuminate, bright green, shining, almost fleshy: fls. 2-6 in a fascicle, white spotted purple, $\frac{1}{2}$ - $\frac{2}{3}$ in. wide, the rounded lobes hairy inside: drupe oblong, about $\frac{1}{2}$ in. long, reddish-purple. New Zeal.

2. **BONTIA**, L. Woody plants with persistent lvs.; a single species in the W. Indies infrequently cult.—Glabrous tree or shrub: lvs. small, scattered, entire: fls. axillary, solitary or clustered; calyx 5-parted; corolla 2-lipped, pilose within, the lower lip reflexed; stamens didynamous, the lower exserted; ovary 2-celled, 4-ovuled: drupe usually 4-seeded. (Bon-tia: named for Jacob Bontius, physician, born at Leiden, 1592-1631.)

B. daphnoides, L. Ten to 30 ft. high: lvs. lanceolate or oblong, 2-4 in. long, acuminate, olive-like: pedicels as long as the fls.; calyx-segms. subulate, ciliate; corolla yellow, variegated with purple, almost 1 in. long: drupe ovate, pointed, about $\frac{1}{2}$ in. long, yellow.

187. RUBIACEÆ. MADDER FAMILY

A marked family of about 425 genera and 5,000 species, mainly trop., many of them important economically, yielding dyes and various medicinal and edible products; many genera and species in cult. in N. Amer., mostly in the greenhouse and in the S. for ornament.—Trees, shrubs or herbs: lvs. opposite or whorled, simple, usually entire: fls. bisexual or rarely unisexual, regular or sometimes slightly irregular; calyx 2-6-cleft or lacking; corolla gamopetalous, 4-6-lobed, mostly valvate; stamens 4-6, epipetalous; ovary inferior, 1- to many-, commonly 2-celled; ovules 1 to many in each cell; style 1, stigma 1, capitate or several-branched: fr. a caps., berry or drupe.—Closely related to the Caprifoliaceæ, but usually having stipules or whorled lvs., or a stipular line connecting the opposite lvs. The genus *Cinchona*, L., is scarcely a hort. subject and is not included here; the bark of several species is collected in Peru and furnishes commercial quinine; in Java it is grown on the *Ledgeriana* stock.

A. Number of ovules in each cell 1.

B. Plants herbaceous or sometimes shrubby at base.

C. Lvs. mostly in whorls of 3 or more.

D. Corolla rotate or rotate-campanulate.

Fig. 187. RUBIACEÆ. A, *Crucianella stylosa*: Aa, flowering stems, $\times \frac{1}{2}$; Ab, flower with subtending bract, $\times 1\frac{1}{2}$; Ac, same, vertical section (corolla-lobes excised), $\times 2$; Ad, ovary, vertical section, $\times 5$; Ae, ovary, cross-section, $\times 8$; Af, stigma, $\times 4$. B, *Ixora coccinea*: Ba, flowering twig, $\times \frac{1}{2}$; Bb, flower, perianth expanded, $\times \frac{1}{2}$; Bc, opening bud tip, vertical section, showing stamens, $\times 1$.

- E. Fls. 5-merous: fr. fleshy..... 1. RUBIA
- EE. Fls. 4-merous: fr. dry..... 2. GALIUM
- DD. Corolla funnellform.
 - E. Fls. 4-merous, with or without bracts and without bractlets; style-branches subequal..... 3. ASPERULA
 - EE. Fls. (in ours) 5-merous, bracted and with bractlets; style-branches unequal..... 4. CRUCIANELLA
- CC. Lvs. opposite.
 - D. Infl. a dense involucrate head..... 5. RICHARDIA
 - DD. Infl. of solitary or twin fls.
 - E. Fls. solitary..... 6. NERTEA
 - EE. Fls. in pairs..... 7. MITCHELLA
- BB. Plants woody, growing to shrubs or small trees.
 - C. Fls. borne in dense globose pedunculate heads..... 8. CEPHALANTHUS
 - CC. Fls. not borne as above.
 - D. Tube of corolla two to three times longer than limb, very slender..... 9. IXORA
 - DD. Tube of corolla not as above.
 - E. Corolla salverform: fr. a berry..... 10. COFFEA
 - EE. Corolla funnellform or campanulate: fr. a drupe.
 - F. Lobes of corolla-limb entire or notched, revolute..... 11. COPROSMA
 - FF. Lobes of corolla-limb obtusely 3-lobed..... 12. SERISSA
 - AA. Number of ovules in each cell more than 1.
 - B. Habit twining..... 13. MANETTIA
 - BB. Habit not twining.
 - C. Fr. a caps.
 - D. Plant a tufted herb..... 14. HOUSTONIA
 - DD. Plant a shrub.
 - E. Seeds winged or appendaged..... 15. BOUVARDIA
 - EE. Seeds not winged or appendaged.
 - F. Stipules multifid or multi-setose..... 16. PENTAS
 - FF. Stipules triangular.
 - G. Fls. (in ours) white, about 3 in. across..... 17. PORTLANDIA
 - GG. Fls. (in ours) not white, not over 1 in. across..... 18. RONDELETIA
 - CC. Fr. not a caps.
 - D. Stamens mostly 4; corolla-lobes 4 (rarely 5)..... 19. HOFFMANNIA
 - DD. Stamens 5-11; corolla-lobes 5-11.
 - E. Lvs. (in ours) usually in whorls of 3; stamens inserted near base of corolla-tube..... 20. HAMELIA
 - EE. Lvs. (in ours) usually opposite: stamens inserted at throat or mouth of corolla-tube.
 - F. Infl. axillary (very rarely terminal).
 - G. Throat of corolla usually glabrous: fr. sessile..... 21. GARDENIA
 - GG. Throat of corolla hairy: fr. shortly pedicelled..... 22. GENTIFA
 - FF. Infl. terminal..... 23. POSOQUERIA

1. **RUBIA**, L. About 40 species in Medit. region, trop. and S. Afr., temp. Asia, trop. and temp. S. Amer., one of economic value.—Per. herbs, sometimes shrubby at base, frequently rather stiff, hispid or prickly: lvs. in whorls of 4-8 or very rarely opposite: fls. small, in axillary or terminal cymes, 5-merous; involucre none; calyx-tube ovoid or globose, the limb lacking; corolla rotate or slightly campanulate; ovary 2-celled with 1 ovule in each cell, or through abortion 1-celled: fr. fleshy. (Ru-bia: Latin *red*, referring to the color of the dye extracted from the root.)

R. tinctorum, L. **MADDER**. Climbing herbaceous per., the long fleshy roots furnishing a dye: lvs. mostly lanceolate, 2-4 in. long, sessile or very short-petioled, not cordate, in whorls of 4-6, prickly-scabrous on the margins and midrib: cymes terminal, paniced, spreading, leafy; fls. greenish-yellow, $\frac{1}{4}$ in. across: fr. red turning black, $\frac{1}{8}$ - $\frac{1}{4}$ in. across. S. Eu., Asia.

2. **GALIUM, L. BEDSTRAW.** Slender herbs, the profuse-flowering species often used in rockeries and fl.-beds for their soft and filmy effect, also in bouquets; about 300 species in various parts of the world.—Sts. mostly square, often barbed: lvs. whorled, sessile, without stipules: fls. very small, usually bisexual, epigynous, 4- (rarely 3-) merous, mostly in axillary or terminal panicles; calyx almost or quite obsolete; corolla rotate, deeply 4-parted, the divisions in our species acute or acuminate; stamens 4; ovary 2-celled, with 1 ovule in each cell, forming a 2-lobed, 2-seeded, dry, indehiscent fr., the lobes nearly globular. (Ga-lium: Galion was the name of a plant mentioned by Dioscorides as used in curdling milk.)—The vernacular name is derived from the old practice of using the plants in the making of beds; **LADIES BEDSTRAW**, so-called because of the legend that one of these plants was in the hay on which the Mother of Christ rested.

- A. Fls. yellow.....1. *G. verum*
 AA. Fls. white.
 B. Lvs. in 4's, several-nerved, not bristle-tipped.....2. *G. boreale*
 BB. Lvs. in 8's or 6's, 1-nerved, bristle-tipped.
 cc. Length of lvs. $\frac{1}{2}$ –1 in., not glaucous.....3. *G. Mollugo*
 cc. Length of lvs. to 1 $\frac{1}{2}$ in., somewhat glaucous.....4. *G. aristatum*

1. **G. verum, L. YELLOW BEDSTRAW.** Per. from a somewhat woody base, glabrous and smooth, or the edges of the lvs. roughish; sts. decumbent or ascending, tufted, 1–3 ft. long: lvs. in 8's or 6's, linear, $\frac{1}{2}$ –1 in. long, bristle-tipped: panicle ample, its lower branches exceeding the lvs.; fls. yellow, blooming all summer: fr. small, smooth. Eu., now also a weed in fields in E. U. S.

2. **G. boreale, L. NORTHERN BEDSTRAW.** Stoloniferous per. forming patches; sts. smooth, 1–3 ft. high, erect, strict: lvs. lanceolate, $\frac{3}{4}$ –1 $\frac{1}{2}$ in. long, not bristle-tipped, mostly in 4's and often with fascicles of smaller ones in the axils, 3-nerved; panicle ample; fls. white: fr. usually minutely bristly or becoming glabrous. Que. to Alaska south to Pa. and Colo.

3. **G. Mollugo, L. WHITE BEDSTRAW. FALSE BABYS-BREATH.** Per., smooth; sts. erect or diffuse, 1–3 ft. long, mostly in clumps: lvs. oblanceolate to linear, $\frac{1}{2}$ –1 in. long, bristle-tipped, 1-nerved, in whorls of 8 or on the branchlets 6: fls. very numerous in ample almost leafless panicles, white: fr. smooth or nearly so. (Mollugo: Latin *mollis*, soft, in reference to the delicate lvs.; an herbalist name, employed also in a genus of the Aizoaceæ.) Eu., but a weed in fields in the eastern states.

4. **G. aristatum, L. FALSE BABYS-BREATH.** Confused with *G. Mollugo* and the plant commonly grown under that name: differs in the longer lanceolate lvs. gradually acuminate at both ends, to 1 $\frac{1}{2}$ in. long, often glaucous beneath, and the hair-like pedicels making a looser panicle. Eu.

3. **ASPERULA, L. WOODRUFF.** Ann. and per. herbs, a few planted in borders and rock-gardens; 90 species, Eu., Asia and Australia.—Sts. square: lvs. whorled (some of the lf.-like organs are really stipules): fls. many, small, mostly 4-merous, produced freely from May to July, without bractlets; calyx inconspicuous; corolla funnellform; style-branches subequal; ovules 1 in each cell: fr. leathery, seldom fleshy. (*Asper-ula*: *roughish*, referring to the lvs.)

- A. Plant ann.: fls. blue.....1. *A. orientalis*
 AA. Plant per.: fls. white or pink.
 B. Lvs. lanceolate, $\frac{1}{4}$ – $\frac{1}{2}$ in. across.....2. *A. odorata*
 BB. Lvs. linear, $\frac{1}{8}$ in. or less across.
 cc. Corolla-tube two to three times longer than lobes.....3. *A. hexaphylla*
 cc. Corolla-tube only slightly longer than lobes.
 dd. Sts. erect: fls. white, often 3-lobed.....4. *A. tinctoria*
 dd. Sts. diffuse or ascending: fls. pink, 4-lobed.....5. *A. cynanchica*

1. **A. orientalis, Boiss. & Hohen. (*A. azurea-selosa*, Hort.).** Branching ann. to 1 ft. high: lvs. in whorls of 8, lanceolate, to $\frac{3}{4}$ or 1 in. long, rough on edges: fls. blue, $\frac{3}{8}$ in. long, in terminal head-like clusters subtended by leafy bristly bracts half as long as fls.; corolla-tube about four times length of lobes: fr. with small lines. Asia Minor, Caucasus.

2. **A. odorata, L. SWEET WOODRUFF.** Rootstock slender and creeping; sts. erect or ascending, 6–12 in. high, glabrous: lvs. in whorls of 6–8, lanceolate, 1–1 $\frac{1}{2}$ in. long and $\frac{1}{4}$ – $\frac{1}{2}$ in. across, bristle-tipped, roughish at the margin, with a hay-like fragrance when dried: fls. white, $\frac{1}{8}$ – $\frac{1}{4}$ in. long, in loose branching cymes; corolla-tube about equalling lobes: fr. very hispid. Eu., Asia, N. Afr.

3. **A. hexaphylla, All. Per.;** sts. glabrous, ascending, slender, 1–2 ft. or more high: lvs. in whorls of 6, linear, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, acute, rough on edges: fls. pink, in small loose heads subtended by bracts shorter than fls.; corolla-tube two to three times longer than lobes: fr. smooth. S. Eu.

4. *A. tinctoria*, L. DYERS WOODRUFF. Per., with reddish creeping rootstock; sts. erect, 1-2 ft. high, glabrous, branching; lvs. in whorls of 4-6, linear, of unequal length, slightly rough on edges; fls. white, about $\frac{1}{2}$ in. long, usually 3-lobed, in branching cymes; corolla-tube slightly longer than lobes; fr. smooth. Eu.—*A. ciliata*, Rochel, is similar, but differs in the finely setose-ciliate lf.-margins and corolla-lobes as long as tube.

5. *A. cynanchica*, L. Per.; sts. decumbent or ascending, much-branched, 10-16 in. high, glabrous; lvs. in whorls of 4, linear, to $\frac{3}{4}$ in. long, of unequal length; fls. pink or lilac, $\frac{1}{8}$ - $\frac{1}{4}$ in. long, in few-fl'd. branching cymes; corolla-tube slightly longer than lobes; fr. thickly tuberculate. Eu. to Caucasus.

4. *CRUCIANELLA*, L. CROSSWORT. About 30 species, native of the Medit. region and W. Asia, one sometimes grown in rock-gardens.—Herbs or half-shrubs; branches usually long, slender, 4-angled: upper lvs. opposite, without stipules; lower lvs. in whorls of 3 or more; fls. small, white, rosy or blue, bracteolate; calyx indistinct; corolla funnelform, 4-5-lobed; style-branches distinctly unequal; ovules 1 in each cell; fr. dry. (Crucianella: Latin a little cross, from the arrangement of the lvs.)

C. stylosa, Trin. (*Phuopsis stylosa*, Benth. & Hook. f.). Prostrate ann. (sometimes grown as a per.), 6-9 in. high; lvs. in whorls of 8 or 9, lanceolate, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, hispid; fls. small, 5-merous, crimson-pink, in round terminal heads $\frac{1}{2}$ in. diam., June-Aug.; style club-shaped, long-exserted, very shortly 2-cleft at apex. Iran.

5. *RICHARDIA*, L. (*Richardsonia*, Kunth). Pubescent or hairy herbs of about 8 American species, one grown in S. U. S. as a forage and cover-crop.—Lvs. opposite, stipules and petioles united into a sheath; fls. in terminal dense involucrate heads; calyx 4-6-parted; corolla funnelform, 4-6-lobed; ovules 1 in each cell; fr. separating into 3-4 carpels. (Richardia: named for R. Richardson, 1663-1741, English physician.)

R. scabra, L. MEXICAN CLOVER. Hairy ann. with prostrate or ascending sts. to 4 ft. long; lvs. oblong to lanceolate, 1-3 in. long, acute, rough; fls. white, to $\frac{1}{4}$ in. long; corolla-tube over three times longer than lobes. S. C. to S. Amer.

6. *NERTERA*, Banks & Soland. Low creeping herbs, one grown in the greenhouse or the open in Calif.; about 8 species widespread in the southern hemisphere.—Slender perennials: lvs. small, opposite, stalked or sessile, glabrous or somewhat pilose; stipules small; fls. solitary, axillary or terminal, bisexual, inconspicuous, sessile; corolla 4-5-lobed, the tube funnelform-orbicular; stamens 4-5, inserted at the base of the corolla-tube, the anthers exserted; ovary 2-celled, ovules 1 in each cell; drupe fleshy, 2-seeded. (Nertera: Greek *lowly*, referring to the habit.)—Gomozia, Mutis, is the older generic name but Nertera has been conserved.

N. granadensis, Druce (*Gomozia granadensis*, L. *N. depressa*, Banks & Soland.). BEAD-PLANT. Glabrous, variable in size, often forming dense mats; sts. 6-10 in. long, 4-angled; lvs. broadly ovate, $\frac{1}{6}$ in. long, acute or obtuse, leathery or almost fleshy, the petioles about as long as the blades; fls. greenish; fr. orange-colored, berry-like, about $\frac{1}{4}$ in. across, lasting from midsummer well into the winter. Cent. to S. Amer., New Zeal., Tasmania.

7. *MITCHELLA*, L. One evergreen trailing herb, scarcely woody, native in N. Amer., and suitable for the rock-garden.—Lvs. opposite, short-petioled; fls. twin, short-peduncled; calyx 4-toothed; corolla funnelform, with 4 spreading lobes; stamens inserted on throat of corolla; ovary 4-celled, ovules 1 in each cell, stigma 4-lobed; fr. a berry-like drupe crowned by persistent calyx. (Mitchella: named for John Mitchell, early American botanist, died 1772.)

M. repens, L. PARTRIDGE-BERRY. TWIN-BERRY. SQUAW-BERRY. Sts. to 1 ft. long, rooting; lvs. orbicular-ovate, $\frac{1}{4}$ - $\frac{3}{4}$ in. long, dark green and shining above and often with white lines; fls. white, fragrant, $\frac{1}{2}$ in. long, the lobes bearded within; fr. scarlet, to $\frac{1}{2}$ in. across. N. S. to Fla. and Tex.

8. *CEPHALANTHUS*, L. BUTTON-BUSH. Ornamental woody plants of 6 species in Amer. and Asia, of which only 1 N. American species is cult.—Shrubs or small trees with opposite or whorled, entire, stipulate lvs.: fls. small, tubular, white or yellowish, 4-merous, in dense globose pedunculate heads; calyx with short obtuse

lobes; stamens included, the filaments inserted on the corolla-throat; style long-exserted; ovary 2-celled, each cell 1-ovuled: fr. dry, separating into 2 nutlets. (Cephalanthus: Greek *head* and *flower*; fls. in heads.)

C. occidentalis, L. Shrub 3-20 ft. high, glabrous or pubescent, deciduous: lvs. ovate to oval-lanceolate, 3-6 in. long, acuminate, shining above, with triangular stipules between the petioles: heads about 1 in. diam., long-peduncled, 3 or more at the ends of the branches, in summer; fls. with setiform bractlets between them; calyx often slightly hairy at base. N. Amer., E. Asia.

9. IXORA, L. Evergreen shrubs or small trees; upwards of 150 species (or split into many more by some authorities) in trop. regions well around the globe, desirable for warmhouse cult.—Lvs. opposite or whorled: fls. showy, in terminal or axillary usually dense corymbs, white, rose or scarlet; pedicels bracteate; corolla with very long and slender tube, the throat sometimes barbed, the limb 4-5-lobed and wide-spreading; stamens 4-5, inserted on the throat, the filaments short or none; style filiform, exserted, 2-branched; ovary on a fleshy disk, 2-celled, ovules solitary: fr. a hard or fleshy 2-pyrenous berry. (Ixo-ra: a Malabar deity.)—There are many garden forms of *Ixora* under Latin names, these complicating a botanical account of the genus; these forms need special study.

- A. Color of fls. white.
- B. Fls. about $\frac{1}{2}$ in. long. 1. *I. parviflora*
- BB. Fls. 1-1 $\frac{1}{2}$ in. long. 2. *I. acuminata*
- AA. Color of fls. red or yellow.
- B. Lvs. 6-12 in. long: infl. of about 100 fls. 3. *I. macrothyrsa*
- BB. Lvs. to 4 in. long: infl. of fewer fls.
- c. Corolla-lobes obtuse. 4. *I. chinensis*
- cc. Corolla-lobes acute. 5. *I. coccinea*

1. ***I. parviflora***, Vahl. Small evergreen tree, much-branched: lvs. oblong or oval, 3-6 in. long, obtuse, glabrous and shining, very short-petioled: fls. white, fragrant, about $\frac{1}{2}$ in. long, in nearly globose clusters: fr. $\frac{1}{4}$ in. across. India, Ceylon.

2. ***I. acuminata***, Roxb. Tall glabrous shrub: lvs. leathery, variable, oval to linear-oblong, to 9 in. and more long, acuminate: fls. white, fragrant, 1-1 $\frac{1}{2}$ in. long and nearly 1 in. across, in many-fld. corymbs 2-4 in. across: fr. $\frac{1}{4}$ - $\frac{3}{4}$ in. long. India.—Often grown as *I. alba* but this Linnæan species was never typified and is unidentifiable, being founded on old pictures.

3. ***I. macrothyrsa***, Moore (*Pavetta macrothyrsa*, Teys. & Binn.). Shrub 3-10 ft. high: lvs. lanceolate to oblong, 6-12 in. long and 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ in. wide, acuminate, somewhat leathery: fls. deep red, to 2 in. long and nearly 1 in. across, in loose puberulent corymbs of about 100 fls. to 8 in. across. Celebes.

4. ***I. chinensis***, Lam. Glabrous shrub: lvs. oval-lanceolate to obovate, 2-3 in. long, subsessile, gradually narrowed to rounded base: fls. yellow turning brick-red, about 1 $\frac{1}{2}$ in. long, in dense corymbs 2-4 in. across having red branches; petals obtuse. Malaya, China.

5. ***I. coccinea***, L. Shrub to 15 ft.: lvs. oval with mostly cordate amplexicaul base, 1-4 in. long: fls. red, 1-1 $\frac{1}{2}$ in. long, in corymbs 2-4 in. across having puberulous green branches; petals acute. India, China. Var. ***Bandhuca***, Corner (*I. Bandhuca*, Roxb.), has broader petals and fuller fls. Var. ***lutea***, Corner (*I. lutea*, Hutchins.), has yellow fls. with broader petals.

10. COFFEA, L. Evergreen shrubs or small trees, producing the coffee of commerce, sometimes cult. for ornament; from 25-40 species in trop. Afr. and Asia, the species not yet clearly defined nor well understood horticulturally.—Lvs. mostly opposite, rarely in 3's: fls. in axillary clusters, cream-colored or white; calyx-limb 5- rarely 4-parted; corolla salverform, the throat sometimes villous; stamens inserted in or below the corolla-throat: fr. a berry; seeds 2, horny, the well-known coffee of commerce. (Coffe-a: from the Arabian name for the drink, itself conjecturally derived from Caffa, a district in S. Abyssinia.)

C. arabica, L. COMMON OR ARABIAN COFFEE. Shrub 10-15 ft. high, at first with one main trunk, later with others developing from this; lateral branches horizontal, opposite or very rarely in whorls of 3: lvs. dark glossy green, opposite, rather thin, elliptic, 3-6 in. long, nearly three times as long as broad, more or less abruptly acuminate, the point about $\frac{1}{2}$ in. long: fls. pure white, star-like, delicately fragrant; corolla-segms. about $\frac{3}{4}$ in. long, longer than the tube; stigma 2-branched: fr. a 2-seeded deep crimson berry, about $\frac{1}{2}$ in. long, the seeds known commercially as "berries" or "beans." Trop. Afr., early intro. into Arabia.—Extensively grown in American tropics and subtropics. A form with variegated lvs. is more showy.

11. **COPROSMA**, Forst. Evergreen shrubs or small trees, sometimes planted for their attractive fr. and shining green or variegated lvs.; about 60 species, Australia and New Zeal., extending to Borneo, Hawaii and Juan Fernandez.—Usually dioecious; low-spreading or upright, with commonly opposite lvs. stalked or nearly sessile: fls. small, solitary or fascicled, white or greenish; corolla funnelform or campanulate, lobes 4-5, revolute; stamens 4-5: fr. an ovoid or globose usually 2-celled drupe. (Copros-ma: Greek name, referring to the fetid odor of the plants.)

C. Baueri, Endl. Shrub or small tree attaining a height of 20-25 ft.: lvs. thick, shining green, broad-ovate or oblong, 1-3 in. long, obtuse or notched at apex, the margins often revolute: staminate fls. in dense heads on short axillary peduncles; pistillate fls. 3-6, in heads with shorter peduncles, calyx very small, corolla tubular, 4-lobed: fr. orange-yellow, ovoid, $\frac{1}{2}$ in. long. (Named after the collector, F. Bauer, 1760-1826, who was in New Zeal. in 1804-1805.) New Zeal.—Forms with yellow or yellowish-green blotches on the lvs. are in cult. Useful for hedges as it withstands clipping.

12. **SERISSA**, Comm. Greenhouse shrub or grown in the open in warm regions; 1 or more species in S. E. Asia.—Glabrous or the branches puberulent, fetid when bruised: lvs. rather small, opposite, subsessile; stipules persistent: fls. small, axillary or terminal, solitary or fascicled, white; calyx-tube obconic, limb 4-6-parted, lobes subulate-lanceolate; corolla funnelform, tube and throat pilose inside, limb 4-6-lobed, the lobes obtusely 3-lobed; stamens 4-6; ovary 2-celled with 1 ovule in each cell, style shorter than stamens, stigma of 2 linear lobes: fr. a subglobose drupe. (Seris-sa: from the Indian name.)

S. foetida, Lam. (*S. japonica*, Thunb.). About 2 ft. high: lvs. rather leathery, ovate, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, acuminate (in a var. yellow-margined): fls. rose-pink in bud, becoming white when expanded, $\frac{1}{4}$ -nearly $\frac{1}{2}$ in. long. Japan.

13. **MANETTIA**, Mutis (*Lygistum*, P. Br.). Graceful twining plants, sometimes grown for their ornamental fls. either under glass or in warmer parts of the country out-of-doors as roof-plants or on trellises, blooming more or less the year round; perhaps 40 species in warmer parts of Amer.—Evergreen herbs or shrubs, glabrous or villous, weak and climbing: lvs. petioled, opposite or rarely whorled: fls. axillary, solitary or in short corymbs or panicles, white, yellow or red; calyx-lobes 4 or 8, sometimes lf.-like; corolla-limb 4-5-lobed, the lobes usually shorter than the tube, erect or recurved; stamens 4-5, inserted at the mouth or in the throat of the corolla: fr. an obovoid or turbinate 2-celled dehiscent many-seeded caps. (Manet-tia: Xavier Manetti, of the botanic garden at Florence, born 1723.)

- A. Fls. $1\frac{1}{2}$ in. long, red. 1. *M. glabra*
- AA. Fls. $\frac{3}{4}$ in. long, red tipped with yellow.
- B. Calyx-lobes erect or spreading; style exserted. 2. *M. bicolor*
- BB. Calyx-lobes reflexed; style about as long as corolla-tube. 3. *M. inflata*

1. **M. glabra**, Cham. & Schlecht. Lvs. cordate-ovate, 1-2 in. long, acuminate, glabrous: fls. solitary, red, $1\frac{1}{2}$ in. long; calyx-lobes erect or spreading; corolla-lobes small, revolute; stamens exserted. S. S. Amer.

2. **M. bicolor**, Paxt. Glabrous: lvs. nearly sessile, lanceolate, acuminate, slightly glaucous: fls. solitary, on short axillary pedicels; calyx-lobes erect or spreading; corolla $\frac{3}{4}$ in. long, somewhat swollen at base, red below and yellow toward the tip, the short lobes spreading-reflexed; style exserted. Brazil.

3. **M. inflata**, Sprague. Differs from the foregoing in the sts. slightly pubescent, lvs. tomentulose on veins beneath, petioled, the leafy reflexed calyx-lobes, corolla more swollen at base and more coarsely hairy, the yellow part much smaller, style (in long-styled plant) about as long as corolla-tube. Paraguay, Uruguay.—Most of the material grown as *M. bicolor* belongs to this species.

14. **HOUSTONIA**, L. Herbs, usually tufted, sometimes planted in rock-gardens; about 25 N. American species.—Lvs. opposite, entire: fls. small, white, blue or purple, solitary or cymose; calyx 4-lobed; corolla funnelform or salverform, 4-lobed; stamens 4, inserted on corolla-tube or throat; ovary 2-celled with numerous ovules in each cell: fr. a caps. free from calyx at top. (Houstonia: named for Dr. William Houston, 1695-1733, physician and botanical collector.)

- A. Fls. in cymes: plant to $1\frac{1}{2}$ ft. high.....1. *H. purpurea*
 AA. Fls. solitary: plant to 7 in. high.
 B. Lvs. orbicular: sts. prostrate.....2. *H. serpyllifolia*
 BB. Lvs. oblanceolate: sts. erect.....3. *H. cærulea*
1. *H. purpurea*, L. Erect tufted per. 8–18 in. high: lvs. ovate to ovate-lanceolate, $\frac{1}{2}$ – $2\frac{1}{2}$ in. long, sessile or the lower ones short-petioled: fls. purple or lilac, $\frac{1}{3}$ in. long, in terminal cymes; corolla-tube twice as long as lobes. Md. to Ga. and Miss.
2. *H. serpyllifolia*, Michx. CREEPING BLUETS. Per. with prostrate matted sts. to 10 in. long: lvs. orbicular to oval, to $\frac{1}{3}$ in. long, abruptly petioled: fls. deep blue, $\frac{1}{8}$ – $\frac{1}{2}$ in. across, solitary on filiform pedicels; corolla-tube slightly shorter than lobes. Pa. to Ga. and Tenn.
3. *H. cærulea*, L. BLUETS. Tufted per. with erect sts. 1–7 in. high: lvs. oblanceolate or spatulate, $\frac{1}{8}$ – $\frac{1}{2}$ in. long, narrowed into petiole: fls. violet, blue or white with yellow eye, $\frac{1}{8}$ – $\frac{1}{2}$ in. across, solitary on filiform pedicels; corolla-tube about length of lobes. N. S. to Ga. and Mo.—Sometimes perennating and mat-forming in shaded situations and there useful as a ground-cover.

15. **BOUVARDIA**, Salisb. Attractive greenhouse plants, once popular as florists' subjects; about 30 species from Tex. and Ariz. to Colombia and southward, chiefly in Mex. and Cent. Amer.—Small shrubs, rarely per. herbs: lvs. opposite or whorled, stipules subulate: fls. red, yellow or white, showy, in terminal cymes; calyx with 4 persistent lobes; corolla long-tubular or salverform, with 4 spreading or erect lobes; stamens 4, alternate with the corolla-lobes and attached in the tube or throat; styles included or exserted; stigmas 2; ovary 2-celled, many-ovuled: fr. a loculicidal caps.; seeds winged. (Bouvardia: Chas. Bouvard, 1572–1658, physician to Louis XIII and superintendent of Royal Gardens in Paris.)—The bouvardias of florists are evergreen derivatives perhaps not represented by any of the type species.

- A. Fls. in shades of red: lvs. normally in 3's except perhaps on the branchlets.
 B. Corolla pubescent outside.....1. *B. ternifolia*
 BB. Corolla glabrous outside.....2. *B. leiantha*
 AA. Fls. white: lvs. opposite.....3. *B. longiflora*
1. *B. ternifolia*, Schlecht. (*Ixora ternifolia*, Cav. *B. triphylla*, Salisb. *B. hirtella*, HBK. *B. Jacquinii*, HBK.). Shrub 2–6 ft. high, sts. hairy when young: lvs. in 3's or 4's, or opposite on the branchlets, lanceolate to ovate, $1\frac{1}{2}$ – $2\frac{1}{2}$ in. long, scabrous or glabrate: infl. few-fl., terminal; fls. red, the tube to 1 in. long, pubescent outside, lobes erect or ascending, stamens included. Mex. to W. Tex.
2. *B. leiantha*, Benth. Shrub, sts. hairy: lvs. in 3's or 4's or opposite on branchlets, ovate, 1–3 in. long, pubescent: infl. many-fl., terminal; fls. deep red, tube $\frac{1}{2}$ in. long and glabrous outside, lobes erect or ascending, stamens included or exserted. Mex. to Costa Rica.
3. *B. longiflora*, HBK. (*Eginetia longiflora*, Cav. *B. Humboldtii*, Hort.). Glabrous shrub 3–5 ft. high: lvs. opposite, ovate to lanceolate, 1–2 in. long: infl. loose; fls. white, very fragrant, the slender tube $1\frac{1}{2}$ –3 in. long, glabrous, lobes spreading and 1 in. or more across, stamens included. Mex.

16. **PENTAS**, Benth. Herbs or subshrubs grown under glass; 30 species in trop. and S. Afr. and Madagascar.—Erect or prostrate, hispid or tomentose: lvs. opposite, petioled, stipules multifid or bristly: fls. usually in corymbs; calyx-lobes 4–6, unequal; corolla pilose, the long tube dilated and villous in the throat, the lobes valvate; stamens 4–6, inserted below the throat; style exserted; disk often produced into a cone after anthesis: caps. membranaceous or leathery, 2-celled, loculicidal; seeds many, minute. (Pen-tas: Greek *five*, referring to the floral parts.)

P. lanceolata, Schum. (*Ophiorrhiza lanceolata*, Forsk. *P. carnea*, Benth., under which name it is known to gardeners). Erect or decumbent, shrubby at base, 1–2 ft. high, hairy: lvs. ovate, elliptic or lance-oblong, 1–6 in. long, $\frac{1}{4}$ – $\frac{1}{2}$ in. wide, more or less acute, narrowed at base into a short petiole: fls. dimorphic, pale purple, to 1 in. long, nearly sessile, in cymose clusters; corolla very hairy at throat, limb spreading, about $\frac{1}{2}$ in. across. Trop. Afr., Arabia.—There are several hort. vars. with fls. white, rosy or carmine-rose.

17. **PORTLANDIA**, P. Br. Woody plants with showy fls. grown in the open far S.; 8–10 species in Mex., W. Indies.—Glabrous shrubs or small trees: lvs. opposite, coriaceous, petiolate, the stipules between the petioles connate with them and forming a sheath: fls. large, white or purple, on axillary peduncles; calyx 4–5-lobed, persistent; corolla large, nearly campanulate or funnelform, 5-lobed; stamens 5; ovary 2-celled with many ovules: fr. a leathery obovoid-oblong caps. (Portlandia: named in honor of the Duchess of Portland, 1715–1785.)

P. platantha, Hook. Evergreen shrub 1½–3 ft. high: lvs. nearly sessile, elliptic-ovate, acute; stipules broadly triangular, obtuse: calyx-lobes 4, lanceolate, leafy, spreading; corolla white, about 3 in. across and 6 in. long, broadly funnellform approaching campanulate, with 5 ovate spreading lobes. (Platantha: Greek *broad-fld.*) Probably trop. Amer., but source unknown; a doubtful species botanically.

18. **RONDELETIA**, L. Evergreen shrubs and trees with clusters of large often fragrant fls., a few species grown under glass or out-of-doors in the extreme S.; more than 100 species in trop. Amer.—Lvs. opposite, rarely in 3's, coriaceous or membranaceous; stipules broad, usually persistent: fls. red, yellow or white, in axillary corymbed or panicled or rarely terminal cymes; calyx-lobes 4–5; corolla-tube usually slender, sometimes swollen, the throat glabrous or bearded; limb 5-lobed or in some species 4-lobed; stamens 4–5; ovary 2-celled, many-ovuled: caps. loculicidal, usually globose. (Rondeletia: named in memory of G. Rondelet, 1507–1566, French physician and naturalist.)

- A. Corolla densely yellow-bearded in throat, pink or dull red.
 B. Lvs. densely pubescent beneath 1. *R. amœna*
 BB. Lvs. glabrous or nearly so 2. *R. cordata*
 AA. Corolla not yellow-bearded in throat, bright orange-red 3. *R. odorata*

1. **R. amœna**, Hemsl. (*Rogiera amœna*, Planch.). Shrub or small tree: lvs. ovate, 3–6 in. long, short-acuminate, short-petioled, densely pubescent beneath, with oblong reflexed stipules: fls. pink, pubescent, the stout tube to ½ in. long, throat densely yellow-bearded. Mex. to Panama.

2. **R. cordata**, Benth. Shrub 3–7 ft. high: lvs. sessile or nearly so, ovate-oblong to ovate, 3–5 in. long, acute or acuminate, glabrous or nearly so, with oblong-triangular obtuse reflexed stipules: fls. pink or dull red, ¼ in. or less across, short-pedicelled, in dense terminal and axillary corymbose cymes; corolla ¾ in. long, strigillose without, the stout tube with densely yellow-hairy throat. Guatemala.

3. **R. odorata**, Jacq. (*R. speciosa*, Lodd.). Shrub to 6 ft.: lvs. ovate to elliptic or oblong, about 2 in. long, often with revolute margins, shortly petioled, hairy along veins beneath, often rugose, stipules triangular, erect: fls. bright orange-red with yellow throat, about ½ in. across, in few- to many-fl'd. terminal cymes; corolla-tube slender, about ½ in. long, the 5 lobes rounded. Cuba, Panama.

19. **HOFFMANNIA**, Sw. Herbs or woody plants cult. for their very showy foliage; species above 50 in Cent. and S. Amer.—Branches terete or 4-angled: lvs. opposite or whorled, conspicuously veined, very showy: fls. small, white, yellow or red; calyx with 4 short lobes; corolla tubular, with 4 (rarely 5) oblong or linear obtuse lobes; stamens mostly 4; disk ring-like or cushion-like; ovary 2–3-celled: fr. an oblong or narrow many-seeded berry. (Hoffmannia: Georg Franz Hoffmann, 1761–1826, professor of botany at Goettingen.)

- A. Fl.-clusters on long stalks 1. *H. discolor*
 AA. Fl.-clusters not on long stalks.
 B. Lvs. oblong-lanceolate 2. *H. Ghiesbreghtii*
 BB. Lvs. round-ovate 3. *H. regalis*

1. **H. discolor**, Hemsl. (*Campylobotrys discolor*, Lem.). Slightly hairy plant about 6 in. high but drooping over the side of the pot or pan and forming a mat, sts. terete: lvs. short-petioled, oblong-obovate, to 6 in. long and 2½ in. wide, satiny green above and rich light purple to green beneath: fls. ½ in. long, red, in long-stalked recurving racemes, on red pedicels. Mex.

2. **H. Ghiesbreghtii**, Hemsl. (*Campylobotrys Ghiesbreghtii*, Lem.). Subshrub to 4 ft., nearly glabrous, sts. 4-angled and narrowly winged: lvs. oblong-lanceolate, usually 1 ft. or less long and 2½–3½ in. wide, acuminate, very strongly veined, purple-red beneath and dark velvety green above, the short winged petiole somewhat decurrent: fl.-clusters crowded in the axils; fls. yellow, with a red spot in the center, ¼ in. long. Mex., Guatemala, collected by Ghiesbreght.—A hort. form has handsomely mottled lvs.

3. **H. regalis**, Hemsl. (*Higginsia regalis*, Hook.). Strong-growing glabrous subshrub, the branches obtusely 4-angled and somewhat fleshy: lvs. large, round-ovate, abruptly acuminate, plicate with arched nerves, purple-red beneath and dark rich green above: fl.-clusters crowded in the axils; fls. yellow, sessile. Mex.

20. **HAMELIA**, Jacq. About 25 species, in trop. and subtrop. Amer.; one grown in the greenhouse or out-of-doors in the extreme S.—Evergreen upright shrubs with herbaceous shoots: lvs. membranaceous, entire, opposite or sometimes in whorls,

petioled, with interpetiolar stipules: fls. short-stalked or sessile, in terminal forking cymes; calyx with 5 short erect persistent lobes; corolla tubular or subcampanulate, contracted at base, the limb with 5 short lobes; stamens 5, the filaments connate below and inserted near base of corolla-tube; ovary 5-celled: fr. a small ovoid or globose berry with numerous minute seeds. (Hamelia: Henri Louis Duhamel du Monceau, 1700-1781, prominent French botanical author.)

H. patens, Jacq. (*H. erecta*, Jacq.). SCARLET-BUSH. To 12 ft., cinereous-pubescent on all young parts: lvs. usually in whorls of 3, elliptic-ovate to oblong, 3-8 in. long, acute or acuminate, petiolate; fls. scarlet-orange, almost sessile along the branches of the 3-5-rayed cyme; calyx-segms. short, triangular; corolla with narrowly cylindric tube about $\frac{3}{4}$ in. long; stamens exceeding the very short corolla-lobes: fr. ovoid, $\frac{1}{4}$ in. long, dark red or purple. Fla. to Paraguay.

21. GARDENIA, Ellis. Two species planted in the open in the S. and one a florists' plant N.; species about 60 in subtrop. regions of the eastern hemisphere.—Glabrous, pubescent or even tomentose shrubs or rarely small trees: lvs. opposite or in 3's, with interpetiolar stipules: fls. large, yellow or white, axillary and solitary or sometimes corymbose; calyx-tube ovoid or obconic, the limb lobed or parted, persistent; corolla salverform or tubular, the limb with 5-11 spreading or recurved contorted lobes; stamens 5-9, inserted on the corolla-throat: fr. leathery or fleshy, sessile, sometimes breaking open irregularly. (Gardenia: after Alexander Garden, 1730-1791, physician of Charleston, S. C., a correspondent of Linnæus.)

A. Calyx with 5 long teeth, about length of corolla-tube. 1. *G. jasminoides*
 A.A. Calyx spathe-like, two to three times shorter than corolla-tube. 2. *G. Thunbergia*

1. **G. jasminoides**, Ellis (*Varneria augusta*, L. *G. florida*, L. *G. radicans*, Thunb. *G. augusta*, Merr.). CAPE-JASMINE. Variable evergreen shrub, 2-6 ft. high, the st. sometimes rooting: lvs. lanceolate to obovate, to 4 in. long, short-acuminate, thick, sometimes variegated: fls. to 3 in. across, often double, waxy, camellia-like, fragrant; calyx ribbed, with 5 long teeth; corolla-tube cylindric, 1-1½ in. long: fr. fleshy, orange-colored, ribbed, 1½ in. long. China. Var. *Fortuniana*, Lindl. (*G. Fortunei*, Hort.), larger-flid. form; presumably the *G. Veitchii* of gardens belongs here.

2. **G. Thunbergia**, L. f. To 10 ft.: lvs. elliptic, 4-6 in. long, acuminate; fls. white, waxy, very fragrant, 3-4 in. across; calyx split down one side; corolla-tube 2½-3 in. long: fr. very hard, white, smooth, 2-2½ in. long. (Thunbergia: a genus in Acanthaceæ, named for C. P. Thunberg, page 52.) S. Afr.

22. GENIPA, L. A W. Indian genus of 3-4 species, one furnishing edible fr.—Trees: lvs. opposite, shortly petioled or sessile, large, leathery, shining; stipules interpetiolar, deciduous: cymes axillary or terminal, few-flid.; fls. white to yellowish, large; calyx campanulate, truncate or 5-6-toothed, persistent; corolla salverform, the limb twisted to the left, 5-6-parted; stamens 5-6, inserted at the top of the corolla-tube; ovary 1-2-celled: fr. a large subglobose edible berry with numerous seeds. (Genipa: Brazilian name.)

G. americana, L. Tree to 50 ft.: lvs. obovate to oblong, to 1 ft. long; pedicels shorter than the calyx; calyx truncate or shallowly crenate; corolla silky, white or light yellow, about 1 in. across, the tube 1 in. long, the 5-6 lobes obtuse, the throat villous: berry russet-brown, about 2½ in. diam., smooth or sparsely tuberculate, glabrous or short-pilose; seeds irregular, thick, nearly ½ in. long, dark brown.—The fr. is largely used in trop. Amer., as a preserve under the name "Genipap"; sometimes called "Marmalade-Box."

23. POSOQUERIA, Aubl. Shrubs or small trees, sometimes grown under glass or in the far S. out-of-doors, for their glossy foliage and fragrant fls.; about 15 species in trop. Amer.—Branches terete, glabrous: lvs. opposite, short-petioled, coriaceous, entire; stipules interpetiolar, rather large, deciduous: fls. fragrant, white, rose or scarlet, in many-flid. terminal corymbs; calyx-limb 5-toothed, persistent; corolla with long slender tube, scarcely dilated at throat, the limb with 5 obtuse subequal lobes, somewhat contorted; stamens 5, inserted at mouth of the corolla; ovary 1-2-celled: berry ovoid, fleshy, rather large, few- to many-seeded. (Posoqueria: from a native name in Guiana.)

P. latifolia, Roem. & Schult. (*Tocoyena latifolia*, Lam. *Oxyanthus isthmia*, Hort.). Large shrub or tree to 20 ft.: lvs. oval to oblong, 4-10 in. long, shortly acuminate, obtuse or

rounded at base; calyx-teeth acute or obtuse; corolla white, the tube 4-6 in. long and about $\frac{1}{2}$ in. diam., the limb abruptly spreading and about 1 in. across; fr. yellow, 2 in. across; seeds black, nearly $\frac{1}{2}$ in. long. W. Indies, Mex. to S. Amer.

Fig. 188. CAPRIFOLIACEÆ. A, *Lonicera tatarica*: Aa, flowering branch, $\times \frac{1}{2}$; Ab, flower, $\times 1$; Ac, same, vertical section, $\times 1$; Ad, ovary, cross-section, $\times 10$. B, *Kolkwitzia amabilis*: Ba, flowering branch, $\times \frac{1}{2}$; Bb, flower and bud, $\times 1$; Bc, corolla expanded, $\times 1$; Bd, ovaries, vertical section, $\times 2$; Be, same, cross-section, $\times 10$. C, *Viburnum tomentosum*: Ca, flowering branch, $\times \frac{1}{4}$; Cb, sterile flower, $\times \frac{1}{2}$; Cc, perfect flower, $\times 3$; Cd, same, vertical section, $\times 3$; Ce, ovary, cross-section, $\times 15$.

188. CAPRIFOLIACEÆ. HONEYSUCKLE FAMILY

A family consisting largely of woody plants, many cult. in N. Amer. for ornamental purposes, a few for their medicinal properties; genera 14 and species about 400, distributed principally in the north temp. zone, a few in the mts. of the tropics.—Shrubs or very rarely herbs: lvs. opposite, simple or pinnate, mostly without stipules; fls. bisexual, regular or irregular; calyx 4-5-toothed or 4-5-fid, the tube adnate to the ovary; corolla gamopetalous, 4-5-lobed, tubular or rotate; stamens as many as lobes of corolla and alternate with them, epipetalous; ovary inferior, 1-5-celled, each cell 1- to many-ovuled, placentation axile, style 1 or obsolete, stigmas 1-5: fr. a berry, caps. or achene.

- A. Corolla rotate or nearly so (except in a few species of *Viburnum*), the limb regular; style short, 3-5-lobed.
- B. Lvs. pinnately cut. 1. *SAMBUCUS*
- BB. Lvs. simple. 2. *VIBURNUM*
- AA. Corolla tubular or bell-shaped, the limb usually irregular; style long, mostly with capitate stigma.
- B. Fr. a berry.
- C. Ovary 5-8-celled. 3. *LEYCESTERIA*
- CC. Ovary 2-4- (rarely 5-) celled.
- D. Shape of corolla regular; ovary 4-celled, 2 of the cells sterile: fr. a berry-like drupe with 2 nutlets. 4. *SYMPHORICARPOS*

- DD. Shape of corolla commonly more or less irregular; ovary 2-3-celled: fr.
a few- to several-seeded berry..... 5. LONICERA
- BB. Fr. an achene or caps.
- C. Plant trailing..... 6. LINNÆA
- CC. Plant upright.
- D. Stamens 4: fr. a 1-seeded achene.
- E. Achene ovoid, bristly..... 7. KOLKWTITZIA
- EE. Achene narrow and long, leathery, not bristly..... 8. ABELIA
- DD. Stamens 5: fr. a 2-valved caps. with numerous seeds.
- E. Fls. yellow, 2-lipped..... 9. DIERVILLA
- EE. Fls. white, pink or crimson, not 2-lipped..... 10. WEIGELA

1. **SAMBUCUS**, L. ELDER. About 20 species in the temp. and subtemp. regions of both hemispheres, furnishing ornamental subjects.—Large and rather coarse shrubs or small trees, rarely per. herbs, some spreading by suckers, the vigorous shoots with large pith: lvs. opposite, odd-pinnate, the lfts. serrate, with or without stipules and stipels: fls. small, usually bisexual and 5-merous, in terminal compound cymes or panicles; calyx-lobes minute; corolla rotate or nearly so; stamens as many as the corolla-lobes, the filaments short; ovary 3-5-celled, style short, 3-5-lobed: fr. a small drupe with 3-5 cartilaginous nutlets. (*Sambucus*: old Latin name for the elder.)

- A. Cymes flat: pith white: fr. black or dark purple.
- B. Fr. glaucous..... 1. *S. cœrulea*
- BB. Fr. not glaucous.
- C. Branches strongly lenticellate: lfts. usually 5..... 2. *S. nigra*
- CC. Branches slightly lenticellate: lfts. usually 7..... 3. *S. canadensis*
- AA. Cymes paniculate: pith brown: fr. red, varying to yellow or white.
- B. Plant glabrous..... 4. *S. racemosa*
- BB. Plant pubescent, at least when young..... 5. *S. pubens*

1. ***S. cœrulea***, Raf. (*S. glauca*, Nutt.). BLUE ELDER. Shrub or tree to 50 ft., with slender branches glaucous when young: lvs. bright green; lfts. 5-7, oblong or oblong-lanceolate, 2½-6 in. long, coarsely serrate, glabrous: fls. yellowish-white, produced in June-July in 5-rayed cymes 4-6 in. across: fr. blue-black, about ¼ in. across, glaucous, Aug.-Sept. B. C. to Calif. and Utah.

2. ***S. nigra***, L. EUROPEAN ELDER. Shrub or tree to 30 ft., with deeply furrowed bark and gray strongly lenticellate branches: lvs. dark green; lfts. 3-7, usually 5, elliptic or ovate, 2-6 in. long, acute or acuminate, serrate, with a short petiolule, usually pubescent beneath while young: fls. yellowish or dull white, with a heavy odor, produced in late spring and early summer in flat 5-rayed cymes 5-8 in. across: fr. globose, shining black, 3-celled, ¼-½ in. diam., ripe in Sept. Eu., W. Asia, N. Afr. Var. *aurea*, Sweet, foliage golden-yellow. Var. *aureo-variegata*, West., lvs. variegated with yellow. Var. *laciniata*, L., lfts. deeply dissected.

3. ***S. canadensis***, L. AMERICAN OR SWEET ELDER. Stoloniferous shrub to 12 ft., with white pith and pale yellowish-gray slightly lenticellate branches: lvs. bright green; lfts. usually 7, elliptic to lanceolate, 2-6 in. long, acuminate, sharply toothed, on short petiolules, the lowest pair frequently 2-3-lobed, the lower surface smooth or slightly downy: fls. white, produced in June-July in 5-rayed cymes to 10 in. across: fr. purplish-black, usually 4-celled, about ¼ in. diam., in Sept. N. S. to Fla and Tex. Var. *acutifolia*, Ellwanger & Barry (var. *laciniata*, Cowell), lfts. much dissected. Var. *aurea*, Cowell, foliage golden-yellow, fr. red.—Sometimes grown for the edible fr. and there are pomological vars.

4. ***S. racemosa***, L. EUROPEAN RED ELDER. Shrub to 12 ft., with branches and pith light brown and young branchlets glabrous: lfts. 5-7, oval or ovate, 2-3 in. long, acuminate, sharply and regularly toothed, glabrous: infl. a dense terminal pyramidal panicle 1½-3 in. high and scarcely as wide in which lower branches are usually reflexed; fls. yellowish-white, blooming in spring: fr. scarlet, 3-seeded, ¼ in. across, in summer. Eu., W. Asia.

5. ***S. pubens***, Michx. (*S. racemosa* var. *pubens*, Wats.). AMERICAN RED ELDER. Shrub to 15 ft., with brownish-red pith and branches pubescent when young: lfts. 5-7, oblong, 2-4 in. long, toothed, pubescent beneath at least when young: infl. a loose pyramidal panicle to 4 in. long in which lower branches are spreading; fls. yellowish-white, in spring: fr. scarlet, about ¼ in. across, in summer. N. B. to Ga. and Colo.

2. **VIBURNUM**, L. Attractive and popular ornamental shrubs; about 120 species in N. and Cent. Amer. and in the Old World from Eu. and N. Afr. to E. Asia, distributed as far south as Java.—Upright mostly rather large shrubs or rarely small trees, the foliage mostly deciduous and assuming a bright fall coloring, or sometimes persistent: lvs. opposite, simple, medium-sized, with or without stipules: fls. small, in terminal paniculate or mostly umbel-like cymes, the marginal fls. sterile and

radiate in several species; calyx with 5 minute teeth; corolla rotate or campanulate, rarely tubular; stamens 5; ovary usually 1-celled, ovule 1 or more and pendulous, style very short, 3-lobed; fr. a drupe with a 1-seeded commonly compressed stone. (Viburnum: ancient Latin name.)

- A. Lvs. habitually lobed.
 - B. Cymes with uniform fls. 1. *V. acerifolium*
 - BB. Cymes with marginal fls. sterile and enlarged.
 - c. Petioles with small glands. 2. *V. trilobum*
 - CC. Petioles with few large disk-like glands.
 - d. Bark thin: lvs. all lobed. 3. *V. Opulus*
 - DD. Bark thick and somewhat corky: lvs. sometimes narrow and unlobed. 4. *V. Sargentii*
- AA. Lvs. not lobed.
 - B. Marginal fls. of cymes sterile and enlarged, sometimes occupying whole head.
 - c. Lf. 4-8 in. long, cordate at base. 5. *V. alnifolium*
 - CC. Lf. 2-4 in. long, rounded at base.
 - d. Veins of lvs. anastomosing before reaching margin: winter-buds naked. 6. *V. macrocephalum*
 - DD. Veins of lvs. straight, ending in points of teeth: winter-buds scaly. 7. *V. plicatum*
 - BB. Marginal fls. of cymes similar to others.
 - c. Foliage persistent.
 - d. Under surface of lvs. gray- or yellow-tomentose. 8. *V. rhytidophyllum*
 - DD. Under surface of lvs. glabrous or nearly so.
 - e. Corolla with tube twice as long as limb. 9. *V. suspensum*
 - EE. Corolla rotate or with tube shorter than limb.
 - f. Veins of lvs. straight, ending in the teeth. 10. *V. japonicum*
 - FF. Veins of lvs. anastomosing before reaching margin.
 - g. Margins of lvs. usually revolute: cymes umbel-like, flat-topped. 11. *V. Tinus*
 - GG. Margins of lvs. not revolute: cymes paniculate. 12. *V. odoratissimum*
 - CC. Foliage deciduous.
 - d. Corolla with cylindrical tube.
 - e. Blooming before the lvs., the infl. nearly glabrous. 13. *V. fragrans*
 - EE. Blooming with the lvs., the infl. tomentose. 14. *V. Carlesii*
 - DD. Corolla rotate-campanulate.
 - e. Cymes sessile (no common peduncle).
 - f. Lf. acuminate; petioles usually with broad wavy margin. 15. *V. Lentago*
 - FF. Lf. obtuse or acute; petioles with narrow not wavy margin. 16. *V. prunifolium*
 - EE. Cymes (whole cluster) peduncled.
 - f. Margins of lvs. nearly entire or finely serrate.
 - g. Under surface of lvs. tomentose: winter-buds naked. 17. *V. Lantana*
 - GG. Under surface of lvs. only slightly pubescent: winter-buds scaly.
 - h. Fr. red at maturity. 18. *V. setigerum*
 - HH. Fr. black at maturity.
 - i. Peduncle as long as or longer than cyme: lvs. usually entire. 19. *V. nudum*
 - ii. Peduncle shorter than cyme: lvs. usually denticulate. 20. *V. cassinoides*
 - FF. Margins of lvs. coarsely dentate.
 - g. Fr. red at maturity.
 - h. Axes of infl. pubescent: lvs. pubescent on both sides. 21. *V. dilatatum*
 - HH. Axes of infl. nearly glabrous: lvs. glabrous except veins beneath. 22. *V. Wrightii*
 - GG. Fr. blue-black at maturity.
 - h. Lf. obovate, narrowed at base. 23. *V. Sieboldii*
 - HH. Lf. ovate to orbicular, rounded or cordate at base.
 - i. Axes of infl. glabrous. 24. *V. dentatum*
 - ii. Axes of infl. pubescent.
 - j. Branchlets light gray, bark flaky: stipules present. 25. *V. molle*
 - JJ. Branchlets grayish-brown, bark not flaky: stipules absent. 26. *V. pubescens*

1. *V. acerifolium*, L. DOCKMACKIE. Deciduous shrub to 6 ft., the slender upright branches downy at first becoming glabrate; winter-buds scaly: lvs. maple-like, 3-lobed, 2-5 in. long, coarsely dentate, with acuminate lobes, pubescent or at length almost glabrous, turning dark purple in autumn: fls. white, $\frac{1}{8}$ in. diam., uniform and bisexual, produced during early summer in long-stalked cymes 2-3 in. across; fr. oval, $\frac{1}{2}$ in. long, red changing to purple-black. N. B. to Minn. south to N. C.

2. *V. trilobum*, Marsh. (*V. americanum*, Auth. not Mill. *V. Oxycoccus*, Pursh). CRANBERRY-BUSH. Deciduous shrub to 12 ft., with gray glabrous branches; winter-buds scaly: lvs. broad-ovate, 2-5 in. long, lobes coarsely toothed or nearly entire, pubescent on the veins beneath or nearly glabrous; petioles with shallow groove and small usually stalked glands; cymes 3-4 in. across, short-peduncled, with marginal showy sterile fls. produced in early summer; stamens exserted: fr. bright scarlet, beginning to color by the end of July and keeping their color till the following spring, $\frac{1}{2}$ in. long. N. B. to B. C. south to N. J. to Ore.

3. *V. Opulus*, L. EUROPEAN CRANBERRY-BUSH. Deciduous shrub to 12 ft., with smooth light gray branches; winter-buds scaly: lvs. maple-like, 2-4 in. long, with 3 (sometimes 4-5) acuminate lobes, coarsely and irregularly toothed, pubescent beneath; petioles $\frac{1}{2}$ -1 in.

long, with 2 narrow stipules near base and few large disk-like glands near lf.-blade; cymes 3-4 in. across, peduncled, with a border of sterile showy white fls. $\frac{3}{4}$ in. diam., the center composed of small fertile fls., in early summer; stamens exserted, the anthers yellow; fr. subglobose, scarlet, $\frac{1}{2}$ in. diam. (*Opulus*: same as *Populus*.) Eu., N. Afr., N. Asia. Var. *roseum*, L. (var. *sterile*, DC.), SNOWBALL, GUELDER-ROSE, all fls. sterile, forming large globose heads. Var. *nanum*, Jacq., is a very dwarf form with small lvs.—There are also variegated strains, and one yellow-fruited var.

4. *V. Sargentii*, Koehne. Deciduous shrub to 12 ft., with dark gray fissured somewhat corky bark; winter-buds scaly: lvs. 3-6 in. long, with 3 toothed lobes or the middle lobe often elongated and entire, or sometimes lvs. oblong-lanceolate and unlobed; petioles $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long, with large disk-like glands; cymes to 4 in. across, long-peduncled, with border of sterile white fls. 1 in. diam., in early summer; stamens exserted, anthers purple; fr. subglobose, scarlet, $\frac{1}{2}$ in. long. (C. S. Sargent, page 51.) N. E. Asia.

5. *V. alnifolium*, Marsh. (*V. lantanoides*, Michx.). HOBBLE-BUSH. AMERICAN WAY-FARING-TREE. Deciduous bushy shrub to 10 ft., the wide-spreading often procumbent branches scurfy-pubescent when young; winter-buds naked: lvs. orbicular or broadly ovate, 3-8 in. broad, acute or short-acuminate, cordate at base, irregularly serrate, nearly glabrous above, scurfy and stellate-pubescent beneath especially on the veins, turning deep claret-red in autumn; petioles 1-2 in. long, scurfy; cymes sessile, 3-5 in. broad; fls. white, the marginal ones enlarged (often 1 in. across) and sterile, on long pedicels, late spring and early summer; fr. ovoid-oblong, dark purple, $\frac{1}{2}$ in. long. N. B. and Mich. to N. C.

6. *V. macrocephalum*, Fort. Deciduous or semi-evergreen shrub to 12 ft. or more, with spreading branches, the young shoots densely stellate-pubescent; winter-buds naked: lvs. oval to ovate-oblong, 2-4 in. long, denticulate, rounded at base, short-petioled, acute or rounded at apex, dark green and sparsely stellate-pubescent above, densely stellate-pubescent beneath; cymes peduncled, 3-5 in. across; fls. pure white, the marginal ones sterile and radiate, $\frac{3}{4}$ -1 in. across, late spring and early summer. China. Var. *sterile*, Rehd. (*V. Fortunei*, Hort.), CHINESE SNOWBALL, has all the fls. sterile and radiate, forming a subglobose ball sometimes 7-8 in. across.

7. *V. plicatum*, Thunb. (*V. tomentosum* var. *sterile*, Koch. *V. tomentosum* var. *plenum*, Rehd.). JAPANESE SNOWBALL. Bushy shrub to 10 ft., deciduous, the spreading branches tomentose when young; winter-buds scaly: lvs. broadly ovate to oblong-ovate, sometimes obovate, 1 $\frac{1}{2}$ -4 in. long, acute or abruptly acuminate, rounded or cuneate at base, dentate-serrate, dark green and nearly glabrous above, stellate-pubescent beneath, at least on the veins; infl. a globose head, with all the fls. sterile. Var. *tomentosum*, Miq. (forma *tomentosum*, Rehd. *V. tomentosum*, Thunb.), is the wild form in China and Japan: infl. a flat umbel-like pubescent cyme, long-peduncled, 2 $\frac{1}{2}$ -4 in. across; marginal fls. white, sterile, long-pedicelled, 1-1 $\frac{1}{2}$ in. across, more or less irregular, May-June: fr. ovoid, red, changing to bluish-black.

8. *V. rhytidophyllum*, Hemsl. Shrub, with stout upright branches and persistent lvs., to 10 ft., branchlets densely stellate-tomentose; winter-buds naked: lvs. ovate-oblong to oblong-lanceolate, 3-7 $\frac{1}{2}$ in. long, entire or slightly denticulate, acute or obtuse, rounded or subcordate at base, stout-petioled, the upper surface dark green and glabrous, lustrous, deeply wrinkled, the lower surface reticulate and covered with thick gray or yellowish stellate tomentum; cymes 4-8 in. across, stellate-tomentose, peduncled; fls. yellowish-white, about $\frac{1}{2}$ in. diam., the buds forming in autumn and remaining exposed all winter and expanding the following May and June: fr. ovoid, $\frac{1}{2}$ in. long, red changing to black, in Sept.-Oct. Cent. and W. China.

9. *V. suspensum*, Lindl. Evergreen shrub reaching 6 ft., the slender branches appearing warty due to the conspicuous lenticels; branches and infl. stellate-pubescent: lvs. oval or oval-oblong, 2-4 in. long, acute or somewhat obtuse, usually crenate-serrate toward the apex, shining and dark green above, paler beneath, glabrous: fls. white, tinged pink, summer-blooming, the dense semi-globose panicles becoming 1 $\frac{1}{2}$ in. across; corolla $\frac{5}{8}$ - $\frac{1}{2}$ in. long, with cylindric tube twice as long as limb; fr. red, subglobose. Liu-kiu Isl.

10. *V. japonicum*, Spreng. (*V. macrophyllum*, Blume). Upright evergreen glabrous shrub to 6 ft. high; winter-buds scaly: lvs. leathery, ovate, 3-6 in. long, acute or short-acuminate, rounded or broadly cuneate at base, remotely dentate except at base, lustrous above; cymes short-peduncled, glabrous, 2-4 in. broad; fls. white, very fragrant, bisexual, uniform, produced in summer: fr. globose, red, $\frac{1}{2}$ in. long. Japan.

11. *V. Tinus*, L. LAURESTINUS. Much-branched evergreen shrub to 10 ft., often cult. as a pot-plant N., the branches glabrous or somewhat hairy: lvs. ovate-oblong or oblong, 2-3 in. long, entire and usually revolute at margins, acute, glossy dark green and glabrous above, commonly pubescent only on the veins beneath; cymes somewhat convex, 2-3 in. broad; fls. white or pinkish-white, slightly fragrant, $\frac{1}{4}$ - $\frac{3}{8}$ in. across, the corolla-limb longer than the tube, in summer or in the greenhouse in winter and early spring; fr. ovoid, black, rather dry. (*Tinus*: pre-Linnæan name for the plant.) Medit. region.

12. *V. odoratissimum*, Ker. Glabrous evergreen shrub to 10 ft., with stout warty branches: lvs. elliptic to elliptic-oblong, 3-6 in. long, acute, remotely serrate toward the

apex or entire, bright glossy green above, paler beneath: fls. pure white, fragrant, produced in late spring and early summer, in broadly pyramidal panicles 4 in. high; corolla rotate-campanulate: fr. red, changing to black. India to Japan.

13. *V. fragrans*, Bunge. Deciduous shrub to 10 ft., with brown slightly pubescent branches: lvs. oval, $1\frac{1}{2}$ –3 in. long, acute, cuneate at base, serrate, slightly pubescent, short-petioled: fls. white or pinkish, in nearly glabrous panicles 1–2 in. long, in Apr.–May before the lvs.; corolla with cylindrical tube and spreading limb $\frac{1}{4}$ – $\frac{1}{2}$ in. across: fr. black or purple. China.

14. *V. Carlesii*, Hemsl. Deciduous much-branched spreading shrub reaching 4 ft., young branchlets stellate-tomentose; winter-buds naked: lvs. broadly ovate or oval, 1–4 in. long, acute, commonly rounded at base, short-petioled, irregularly toothed, dull green above, pale beneath, stellate-pubescent on both surfaces: fls. salverform, about $\frac{1}{2}$ in. long and with limb as wide, fragrant, changing from pinkish to white, in dense subglobose cymes 2–3 in. across, appearing in spring with the lvs.: fr. blue-black, $\frac{1}{3}$ in. long. (Named after W. R. Carles, the collector of this species.) Korea.—A hybrid between *V. Carlesii* and *V. utile* is *V. Burkwoodii*, Burkwood, semi-evergreen, lvs. shining above and gray-tomentose beneath veined with brown, corolla-tube about equalling lobes.

15. *V. Lentago*, L. SHEEP-BERRY. NANNY-BERRY. Slender-branched deciduous shrub or small tree to 30 ft., with long-pointed scaly winter-buds: lvs. ovate, 2–4 in. long, acuminate, finely and sharply serrate, glabrous or scurfy on the veins beneath; petioles $\frac{1}{2}$ –1 in. long, usually winged with wavy margin: cymes sessile, many-fl., 2–5 in. broad; fls. white, in late spring and early summer: fr. oval, $\frac{1}{2}$ in. long, bluish-black, bloomy, remaining until spring. (Lentago: same as Lantana, an old name once applied to Viburnum.) Hudson Bay to Ga. and Miss.

16. *V. prunifolium*, L. BLACK-HAW. Spreading deciduous shrub or small tree to 15 ft., with short-pointed glabrous or reddish-pubescent scaly winter-buds: lvs. roundish to ovate or oval, 1–3 in. long, finely and sharply serrate, acute or obtuse, glabrous or nearly so; petioles $\frac{1}{2}$ – $\frac{1}{2}$ in. long, often with narrow entire margins, glabrous or rusty-tomentose: cymes sessile, 2–4 in. broad; fls. pure white, $\frac{1}{4}$ in. across, produced in spring and early summer: fr. oval to subglobose, bluish-black, glaucous, about $\frac{1}{2}$ in. long. Conn. to Fla. and Tex.

17. *V. Lantana*, L. WAYFARING-TREE. Deciduous shrub to 15 ft., or sometimes tree-like, with young branches scurfy-pubescent; winter-buds naked: lvs. ovate to ovate-oblong, 2–5 in. long, acute or obtuse, cordate or rounded at base, minutely toothed, slightly stellate-pubescent and wrinkled above, stellate-tomentose beneath; petioles $\frac{1}{2}$ –1 in. long, tomentose: fls. white, $\frac{1}{4}$ in. across, produced in May–June, in peduncled pubescent cymes 2–4 in. broad: fr. ovoid-oblong, $\frac{1}{2}$ in. long, bright red changing to almost black. (Lantana: old name once applied to Viburnum.) Eu., W. Asia.

18. *V. setigerum*, Hance (*V. theiferum*, Rehd.). Deciduous shrub to 12 ft., branchlets glabrous; winter-buds scaly: lvs. ovate-oblong, 3–5 in. long, acuminate, slightly denticulate, dark green above, glabrous except on veins beneath; petioles about $\frac{1}{2}$ in. long, glabrous: cymes short-peduncled, 1–2 in. across; fls. May–June: fr. ovoid, red, $\frac{1}{3}$ in. long. China.

19. *V. nudum*, L. SMOOTH WITHE-ROD. Deciduous shrub to 15 ft.; winter-buds scaly: lvs. oval to obovate or oval-lanceolate, 2–5 in. long, acute or obtuse, mostly entire and somewhat revolute or obscurely crenulate, scurfy on both sides when young, becoming glabrous above: cymes long-peduncled, 3–5 in. broad; fls. white or yellowish-white, in summer: fr. globose, $\frac{1}{4}$ in. long, blue-black. L. I. to Fla. and La.

20. *V. cassinoides*, L. (*V. nudum* var. *cassinoides*, Torr. & Gray). WITHE-ROD. Deciduous shrub attaining 12 ft.; winter-buds scaly: lvs. oval to ovate, 1–4 in. long, acute or bluntly acuminate, cuneate or rounded at base, usually obscurely dentate, nearly glabrous, rather thick, dull green above: fls. and fr. similar to those of the preceding species but the peduncles usually shorter than the cyme. Newf. to N. C. and Minn.

21. *V. dilatatum*, Thunb. Deciduous shrub to 10 ft., with erect sts. and branches pubescent when young; winter-buds scaly: lvs. roundish or broadly ovate or obovate, 2–5 in. long, usually abruptly short-acuminate, rounded or subcordate at base, saliently toothed, somewhat hairy on either side: cymes stalked, pubescent, 3–5 in. across; fls. May–June, white, corolla pubescent outside: fr. ovate, scarlet, $\frac{1}{2}$ in. long, numerous, remaining a long time on the branches. China, Japan.

22. *V. Wrightii*, Miq. Deciduous shrub to 10 ft., branchlets nearly glabrous; winter-buds scaly: lvs. broad-ovate, 3–6 in. long, abruptly acuminate, rounded at base, coarsely dentate, glabrous except on veins beneath, turning red in autumn: cymes short-peduncled, nearly glabrous, 2–4 in. across; fls. white, May–June: fr. ovoid, red, $\frac{1}{2}$ in. long. (Named for Chas. Wright, 1811–1886, American botanist.) Japan.

23. *V. Sieboldii*, Miq. Stout shrub to 10 ft., with young branches pubescent and deciduous foliage exhaling disagreeable odor when bruised: lvs. oval or oblong-obovate, 3–6 in. long, coarsely crenate-serrate except toward the base, acute or rounded at apex, narrowed at base, glossy dark green above, paler and stellate-pubescent beneath: fls. creamy-

white, rotate-campanulate, in panicles $2\frac{1}{2}$ –4 in. broad, May–June; fr. oblong, changing from pink to bluish-black, dropping soon after ripening. (P. F. von Siebold, page 51.) Japan.

24. *V. dentatum*, L. ARROW-WOOD. Nearly glabrous deciduous shrub to 15 ft.; winter-buds scaly: lvs. broadly ovate or rotund, $1\frac{1}{2}$ –3 in. long, acute or short-acuminate, rounded or cordate at base, coarsely toothed, pubescent only in the axils of the veins beneath; petioles $\frac{1}{2}$ –1 in. long, glabrous: cymes umbel-like, long-peduncled, glabrous, 2–3 in. broad; fls. white, $\frac{1}{2}$ in. across, May–June; fr. subglobose, $\frac{1}{4}$ in. long, bluish-black, glaucous. N. B. to Minn. south to Ga.

25. *V. molle*, Michx. Deciduous bushy shrub to 12 ft., older bark separating in thin flakes and peeling off: lvs. broadly ovate to rotund, 3–5 in. long, short-acuminate, cordate at base, long-petioled, stipulate, coarsely dentate, glabrous above, more or less pubescent beneath: cymes long-peduncled, finely pubescent, about $2\frac{1}{2}$ in. broad; fls. white, $\frac{1}{4}$ in. across, in June; fr. oval, bluish-black, scarcely $\frac{1}{2}$ in. long. Ind. to Ky. and Mo.

26. *V. pubescens*, Pursh (*V. venosum*, Britt. *V. nepalense*, Hort.). Deciduous shrub to 12 ft., young branches and petioles stellate-pubescent: lvs. ovate to rotund, 2–4 in. long, acute or acuminate, rounded or cordate at base, coarsely and sharply toothed, glabrous or nearly so above, stellate-pubescent beneath particularly on the veins and in their axils: cymes long-stalked, $2\frac{1}{2}$ –4 in. across, stellate-pubescent; fls. white, $\frac{1}{2}$ in. across, June–July; fr. globose or roundish-oval, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, blue-black. Mass. to Va.

3. **LEYCESTERIA**, Wall. Deciduous shrubs cult. in warm regions; species 3, Himalayan and Chinese.—Lvs. opposite, simple, with very small or no stipules: fls. in erect or drooping verticillate leafy-bracted spikes; calyx persistent, unequally 5-lobed; corolla funnellform, nearly equally 5-lobed and swollen at base; stamens 5, inserted on the corolla-tube; ovary 5–8-celled, the stigma capitate: fr. a many-seeded berry. (Leycesteria: Wm. Leycester, judge in Bengal.)

L. formosa, Wall. HIMALAYA-HONEYSUCKLE. Vigorous shrub attaining 6 ft., branches hollow: lvs. broadly ovate to ovate-lanceolate, 2–7 in. long, long-acuminate, cordate at base, entire or finely toothed, glabrous or finely puberulent beneath: spikes drooping, 1–4 in. long; fls. purplish, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, each whorl subtended by claret-colored leafy bracts which persist until the fr. is ripe: fr. dark red, glandular-pubescent, subglobose, about $\frac{1}{2}$ in. long, in autumn. Himalayas, 5,000–10,000 ft., to W. China.

4. **SYMPHORICARPOS**, Duham. About 15 species of deciduous ornamental shrubs, native in N. Amer. south to Mex. and 1 in W. China; many of the American species are very closely related and difficult to distinguish.—Lvs. opposite, simple, entire or sometimes sinuately toothed or lobed, exstipulate: fls. short-pedicelled, in terminal or axillary clusters or spikes or sometimes solitary; calyx 4–5-toothed; corolla campanulate or salverform, 4–5-lobed, nearly regular; stamens as many as the corolla-lobes, included or somewhat exserted; style slender, stigma capitate; ovary with 2 fertile and 2 sterile cells: fr. a berry-like drupe with 2 nutlets. (Symphoricarpos: Greek to bear together and fruit, referring to the clustered frs.)

- A. Fr. red.....1. *S. orbiculatus*
- AA. Fr. white or pinkish.
- B. Style and stamens exserted.....2. *S. occidentalis*
- BB. Style and stamens included.
- C. Plant upright.....3. *S. albus*
- CC. Plant diffuse or procumbent.
- D. Lvs. and young twigs soft-pubescent.....4. *S. acutus*
- DD. Lvs. and young twigs sparsely hairy to glabrous.....5. *S. hesperius*

1. *S. orbiculatus*, Moench (*Lonicera Symphoricarpos*, L. *S. vulgaris*, Michx.). INDIAN-CURRENT. CORAL-BERRY. Bushy shrub 3–7 ft. high; branchlets slender, upright, densely leafy, downy: lvs. broadly oval or ovate, $\frac{3}{4}$ – $1\frac{1}{2}$ in. long, obtuse or acute, somewhat glaucous and usually pubescent beneath, very shortly petioled: fls. produced in summer, in dense short axillary clusters or spikes from the lower sides of the twigs; corolla campanulate, $\frac{1}{8}$ – $\frac{1}{4}$ in. long, dull white; style hairy: fr. purplish-red, subglobose, $\frac{1}{6}$ – $\frac{1}{4}$ in. across, in late autumn. N. J. to Ga. and Tex.; sometimes escaped.—A hybrid between *S. orbiculatus* and *S. microphyllus* is *S. Chenaultii*, Rehd., with small lvs. pubescent beneath and red frs. spotted with white.

2. *S. occidentalis*, Hook. WOLFBERRY. Shrub to 4 ft., with upright rather stiff branches: lvs. oval or ovate, 1–3 in. long, entire or undulate-crenate, apiculate, grayish-green and pubescent beneath: fls. in summer, in dense axillary or terminal spikes or racemes $\frac{1}{2}$ –1 in. long; corolla pinkish-white, campanulate, $\frac{1}{4}$ in. long, deeply 5-lobed; style and stamens exserted: fr. subglobose, white, about $\frac{1}{2}$ in. long, produced in early autumn. Mich. to B. C. south to Colo. and Kans.

3. *S. albus*, Blake (*Vaccinium album*, L. *S. racemosus*, Michx.). SNOWBERRY. WAX-BERRY. Shrub to 3 ft., with upright slender branches: lvs. round-oval to oblong, 1–2 in. long, obtuse, often apiculate, pubescent beneath, those on the young shoots often sinuately lobed: fls. in terminal or axillary spikes or clusters, all summer; corolla campanulate, pinkish, about $\frac{1}{4}$ in. long; style and stamens included: fr. globose or ovoid, snow-white, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, maturing in autumn and persisting through the winter. N. S. to Minn. and Va. Var. *lævigatus*, Blake (*S. racemosus* var. *lævigatus*, Fern. *S. rivularis*, Suks.), to 6 ft.; lvs. glabrous, usually larger; fr.-clusters larger; Alaska to Calif. and Colo.; this var. is the snowberry generally cult. as *S. racemosus*.

4. *S. acutus*, Dieck (*S. mollis* var. *acutus*, Gray). Low diffuse or procumbent soft-pubescent shrub: lvs. oval to ovate, $\frac{1}{2}$ –1 in. long, acute at both ends, grayish or whitish beneath, often irregularly dentate: fls. in summer, solitary or in 2's in the axils of upper lvs.; corolla campanulate, pink, about $\frac{1}{4}$ in. long: fr. subglobose, white, $\frac{1}{4}$ in. long. Ore., Calif., Nev.

5. *S. hesperius*, G. N. Jones (*S. mollis*, Macoun and Hort. not Nutt.). Distinguished from *S. acutus* by being less pubescent, the hairs short and curved rather than straight and spreading, lvs. nearly glabrous except on veins beneath. B. C. to Calif. and Ida.

5. LONICERA, L. HONEYSUCKLE. Shrubs widely planted for ornament; about 180 species throughout the northern hemisphere in Amer. south to Mex. and in Asia south to Java.—Deciduous or rarely half-evergreen or evergreen, erect or climbing: lvs. opposite, simple, entire or rarely sinuately lobed, usually short-petioled, sometimes with distinct stipules; fls. more or less irregular, in axillary peduncled pairs subtended by 2 bracts and 4 bractlets, the latter often more or less connate or sometimes wanting, or fls. in sessile whorls at the ends of the branches; calyx 5-toothed; corolla with short or slender often gibbous tube, 2-lipped or almost equally 5-lobed; stamens 5; style slender, stigma capitate; ovary usually 2–3- rarely 5-celled: fr. a few- to many-seeded berry. (Lonicera: after Adam Lonicer or Lonitzer, 1528–1586, German physician and naturalist.)

- A. Fls. in usually 6-fld. whorls at ends of branchlets, or sometimes axillary, but not paired.
 - B. Limb of corolla very short, the lobes nearly regular. 1. *L. sempervirens*
- BB. Limb of corolla as long or half as long as tube, 2-lipped.
 - C. Corolla about 1 in. long.
 - D. Style and inside of corolla-tube pubescent: disk formed by connate upper lvs. very glaucous above. 2. *L. prolifera*
 - DD. Style and inside of corolla-tube glabrous: disk of connate upper lvs. bright green above. 3. *L. flava*
- CC. Corolla $1\frac{1}{2}$ –3 in. long.
 - D. Upper lvs. distinct. 4. *L. Periclymenum*
 - DD. Upper lvs. connate.
 - E. Tube of corolla slightly longer than limb: whorls usually sessile in axils of connate lvs. 5. *L. Caprifolium*
 - EE. Tube of corolla one and a half times longer than limb: whorls usually in long-peduncled heads. 6. *L. etrusca*
- AA. Fls. in axillary pairs.
 - B. Habit climbing.
 - C. Length of fls. 4–7 in. 7. *L. Hildebrandiana*
 - CC. Length of fls. $\frac{1}{2}$ –1 $\frac{1}{2}$ in.
 - D. Bracts subtending fls. ovate, leafy. 8. *L. japonica*
 - DD. Bracts subtending fls. subulate, small. 9. *L. Henryi*
 - BB. Habit not climbing, branches erect or spreading, rarely prostrate.
 - C. Corolla with regular or nearly regular 5-lobed limb.
 - D. Bracts ovate.
 - E. Stamens as long as corolla-limb: lvs. nearly glabrous beneath. 10. *L. involucreta*
 - EE. Stamens not exceeding corolla-tube: lvs. pubescent beneath. 11. *L. Ledebouri*
 - DD. Bracts linear or subulate.
 - E. Base of corolla not gibbous.
 - F. Stamens and style exserted: fr. bluish or whitish. 12. *L. spinosa*
 - FF. Stamens and style included: fr. red.
 - G. Lvs. white-tomentose beneath. 13. *L. thibetica*
 - GG. Lvs. glabrous beneath. 14. *L. syringantha*
 - EE. Base of corolla gibbous or saccate.
 - F. Lvs. deciduous: frs. seemingly connate. 15. *L. cærulea*
 - FF. Lvs. persistent or semi-persistent, shining above: frs. distinct.
 - G. Branches upright: lvs. $\frac{1}{4}$ – $\frac{1}{2}$ in. long. 16. *L. nitida*
 - GG. Branches spreading or prostrate: lvs. $\frac{1}{4}$ –1 $\frac{1}{2}$ in. long. 17. *L. pileata*
 - CC. Corolla 2-lipped.
 - D. Branches with solid white pith.
 - E. Lvs. not apiculate: branchlets hispid with recurved bristles. 18. *L. Standishii*
 - EE. Lvs. apiculate: branchlets glabrous. 19. *L. fragrantissima*
 - DD. Branches hollow, with brown pith.

- E. Fr. white and translucent.....20. *L. quinquelocularis*
 EE. Fr. red or rarely yellow.
 F. Peduncles shorter than petioles.....21. *L. Maackii*
 FF. Peduncles much longer than petioles.
 G. Outside of corolla glabrous.
 H. Color of fls. pale pink to crimson, or if white not fading to yellow: lvs. $\frac{1}{2}$ -2 in. long.
 I. Lvs. mostly 1-2 in. long, dark green above: lateral lobes of upper lip divided to base of limb or nearly so.....22. *L. tatarica*
 II. Lvs. $\frac{1}{2}$ -1 in. long, distinctly pale blue-green above: lateral lobes of upper lip divided to middle or less....23. *L. Korolkowii*
 HH. Color of fls. white fading to yellow after anthesis: lvs. 2-4 in. long.....24. *L. Ruprechtiana*
 GG. Outside of corolla pubescent.
 H. Stamens glabrous: bractlets about as long as ovaries.....25. *L. Morrowii*
 HH. Stamens pubescent below middle: bractlets half or less as long as ovaries.
 I. Lvs. acuminate.....26. *L. chrysantha*
 II. Lvs. acute or obtuse.....27. *L. Xylosteum*

1. *L. sempervirens*, L. TRUMPET HONEYSUCKLE. Glabrous high-climbing shrub, evergreen southward; lvs. oval or oblong, $1\frac{1}{2}$ -3 in. long, obtuse or rounded and often apiculate at apex, glaucous beneath, the uppermost 1-2 pairs connate at base: fls. in a pedunced interrupted terminal spike consisting of several usually 6-fld. whorls, not fragrant, late spring to early autumn; corolla orange-scarlet outside, yellow within, $1\frac{1}{2}$ -2 in. long, the short limb with nearly equal lobes, the slender tube slightly swollen at base; stamens and style slightly exserted: fr. scarlet, $\frac{1}{4}$ in. diam. Conn. to Fla. and Tex.; farther north sometimes escaped from cult.—There are several vars. with fls. yellow, orange-red or more brilliant scarlet, and a late-flowering improved variant known as *magnifica*. A hybrid between *L. sempervirens* and *L. hirsuta* is *L. Brownii*, Carr. (*L. etrusca* var. *Brownii*, Regel), differing in the limb somewhat 2-lipped, and lvs. sparingly pubescent beneath. *L. Tellmanniana*, Spaeth, is a hybrid between *L. sempervirens* and *L. tragophylla*, with larger lvs. and deep yellow 2-lipped fls. 2 in. long, the corolla-tube about twice as long as limb. A hybrid probably between *L. americana* and *L. sempervirens* is *L. Heckrottii*, Rehd., with 2-lipped fls. to 2 in. long, purplish outside and yellow inside.

2. *L. prolifera*, Rehd. (*Caprifolium proliferum*, Kirchn. *L. Sullivantii*, Gray). Climbing, very glaucous: lvs. oval, obovate or oblong, 2-4 in. long, often finely pubescent beneath, sessile or connate, the uppermost into an orbicular disk very glaucous above: fls. in short-stalked spikes of several whorls each, June-July; corolla 2-lipped, about 1 in. long, pale yellow, often purplish-marked outside, the slender tube slightly swollen on one side and only a little longer than limb, pubescent within; stamens exserted; style hairy: fr. scarlet, $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. Ohio to Tenn. and Mo.

3. *L. flava*, Sims. Climbing: lvs. broadly oval to elliptic, $1\frac{1}{2}$ -3 in. long, glaucous beneath, glabrous, the upper connate into a broad disk bright green above: fls. bright or orange-yellow, fragrant, 1-1 $\frac{1}{4}$ in. long, in a pedunced head, May-June; corolla-tube slender, not swollen, longer than the limb, glabrous inside; style glabrous; stamens exserted: fr. red, $\frac{1}{4}$ in. diam. N. C. to Okla.—Rare in cult. and *L. prolifera* is often grown under this name.

4. *L. Periclymenum*, L. WOODBINE. Twining shrub, the sts. often over 20 ft. long: lvs. all distinct, ovate to oblong-ovate, $1\frac{1}{2}$ -3 in. long, mostly acute, dark green above, pale or glaucous beneath and sometimes sparingly pubescent: fls. very fragrant, in a dense pedunced terminal head, summer to early autumn; corolla 2-lipped, yellowish-white, usually carmine or purple outside, $1\frac{1}{2}$ -2 in. long, the tube slender, tapering, glandular-pubescent outside; stamens and style exserted: fr. red. (Periclymenum, herbalist name: Greek *around* and *surround*, referring to the twining habit.) Eu., N. Afr., W. Asia.—There are several vars., one with lvs. sinuately lobed. Var. *belgica*, Ait., DUTCH WOODBINE, has glabrous lvs. whitish beneath and fls. pale purple outside. Var. *aurea*, Lind. & André, has yellow or yellowish lvs.

5. *L. Caprifolium*, L. (*L. pallida*, Host). Deciduous climber to 20 ft., glabrous or nearly so: lvs. oval, 2-4 in. long, rounded at apex, the 2-3 uppermost pairs connate forming a cup: fls. fragrant, $1\frac{1}{2}$ -2 in. long, in whorls of usually 2-3, produced in the axils of the connate lvs., May-June; corolla 2-lipped, yellowish-white, often slightly purplish and hairy outside, the tube slender: fr. orange-colored, the bractlets very small or none. (Caprifolium, herbalist name: Latin *goat* and *leaf*, i. e., a plant which climbs like a goat.) Cent. Eu. to W. Asia; sometimes escaped from cult.—A hybrid sometimes grown as *L. Caprifolium* and with *L. etrusca* as the other parent is *L. americana*, Koch, fls. yellowish, usually purplish and glandular-pubescent outside, June-July.

6. *L. etrusca*, Santi. Vigorous climber, partially evergreen: lvs. broadly oval to obovate, 1-3 in. long, usually obtuse, glabrous above, pubescent and glaucous beneath, the upper ones connate into an oval obtuse disk: fls. fragrant, in dense usually long-pedunced heads borne in terminal or axillary groups of 3, June-July; corolla yellowish-white, usually reddish tinged, 2-lipped, $1\frac{1}{2}$ -2 in. long, with very slender tube sometimes glan-

dular: fr. red, bractlets nearly as long as ovary. Distributed through the whole Medit. region in many different forms.

7. *L. Hildebrandiana*, Coll. & Hemsl. GIANT HONEYSUCKLE. Evergreen glabrous climber: lvs. ovate, 3-6 in. long and $1\frac{1}{2}$ -4 in. wide, abruptly acuminate, rounded at base: fls. in axillary short-peduncled pairs, fragrant, creamy-white changing to orange, 4-7 in. long, 2-lipped, with slender tube and limb 2-3 in. across; stamens included: fr. ovoid, 1-1 $\frac{1}{4}$ in. long. (Named about 1890 for Mr. Hildebrand, supt. of the Southern Shan States.) Burma.—Not hardy N.

8. *L. japonica*, Thunb. Half-evergreen climber to 20 or even 30 ft., with hollow twining sts., branchlets usually hairy when young: lvs. ovate or oblong, $1\frac{1}{2}$ -3 $\frac{1}{2}$ in. long, acute or obtuse and apiculate, pubescent, becoming glabrous above: fls. white, often purplish outside, changing to yellow, fragrant, produced all summer, in axillary pairs on young shoots, often much crowded toward the ends; peduncles short, bearing 2 ovate bracts $\frac{1}{2}$ - $\frac{3}{4}$ in. long; bractlets half to as long as the ovary; corolla $1\frac{1}{4}$ -1 $\frac{1}{2}$ in. long, pubescent, the tube slender, the limb 2-lipped: fr. black, distinct. E. Asia; nat. in some places from N. Y. to N. C. Var. *aureo-reticulata*, Nichols. (*L. aureo-reticulata*, Moore), lvs. smaller, veined with yellow. Var. *chinensis*, Baker (*L. chinensis*, Wats.), fls. carmine outside, young lvs. tinged with purple. Var. *Halliana*, Nichols. (*L. flexuosa* var. *Halliana*, Dipp.), fls. pure white changing to yellow. Var. *repens*, Rehd. (var. *flexuosa*, Nichols. *L. brachypoda* var. *repens*, Sieb.), lower lvs. often veined with purple.

9. *L. Henryi*, Hemsl. Twining or prostrate, partially evergreen, branchlets hairy: lvs. oblong-lanceolate, 2-3 in. long, acute or acuminate, ciliate, pubescent on midrib beneath: fls. in peduncled pairs, often congested near ends of branches, in summer; corolla $\frac{1}{2}$ - $\frac{3}{4}$ in. long, yellowish- or purple-red, tube and limb nearly equal: fr. black. (Named for Augustine Henry, page 45.) China.

10. *L. involucrata*, Banks (*Xylosteon involucratum*, Richardson. *Distegia involucrata*, Cockerell). Upright shrub 3-9 ft. high, glabrous or somewhat pubescent: lvs. elliptic-ovate to oblong-lanceolate, 2-5 in. long, acutish to acuminate, bright green, glabrous or slightly hairy beneath, short-petioled: fls. yellow or tinged with red, about $\frac{1}{2}$ in. long, borne in pairs on long erect axillary peduncles, subtended by broad bracts which are often reddish or purple, May-June; corolla-tube saccate on one side at base, the limb with nearly equal spreading lobes, glandular-pubescent outside; stamens as long as limb: fr. black, shining, globose, almost inclosed by the enlarged purple bractlets. Que. to Alaska south to Mex.

11. *L. Ledebouri*, Esch. (*Distegia Ledebouri*, Greene). Erect shrub to 8-9 ft.: lvs. ovate-oblong, 2-4 in. long, dull dark green above, downy beneath, short-petioled: fls. in summer, deep orange-yellow tinged with red, in axillary pairs on a downy erect stalk 1-1 $\frac{1}{4}$ in. long, subtended by 2 reddish bracts and bractlets, these enlarged in fr.; corolla tubular, to $\frac{3}{4}$ in. long, saccate at base, the lobes rounded and erect; stamens not longer than tube: fr. black, almost enveloped by the bractlets, ripening in late summer and autumn. (C. F. v. Ledebour, page 47.) Calif.

12. *L. spinosa*, Walp. Stiff shrub to 4 ft., the spinescent branches with solid white pith: lvs. linear-oblong, $\frac{1}{2}$ -1 in. long, glabrous: fls. $\frac{3}{4}$ in. long, in axillary pairs; corolla with slender cylindric tube and spreading limb; stamens and style exserted; bracts linear: fr. pale bluish-red or whitish, bloom-covered, $\frac{1}{2}$ in. diam. Himalayas. Var. *Albertii*, Rehd. (*L. Albertii*, Regel), graceful shrub with slender arching or procumbent unarmed branches; lvs. linear or linear-lanceolate, $\frac{1}{2}$ -1 $\frac{1}{4}$ in. long, sometimes with 2-4 teeth at base, glaucous or bluish-green; fls. rosy-pink, fragrant, June; Turkestan.

13. *L. thibetica*, Bur. & Franch. Shrub to 5 ft., with spreading sometimes prostrate branches: lvs. often in 3's, oblong-lanceolate, $\frac{1}{2}$ -1 $\frac{1}{4}$ in. long, acute, shining dark green above, white-tomentose beneath: fls. in axillary peduncled pairs in May-June, pale purple, $\frac{1}{2}$ in. long; corolla-tube two to three times longer than limb, pubescent outside: fr. red, $\frac{1}{4}$ in. long. China.

14. *L. syringantha*, Maxim. Glabrous shrub 8-10 ft. high, with slender upright branches: lvs. often in 3's, oval or oblong, $\frac{1}{2}$ -1 in. long, acute or obtuse: fls. in axillary pairs in May-June, pinkish or lilac, $\frac{1}{2}$ in. long, fragrant; corolla-tube three to four times longer than limb: fr. red, $\frac{1}{4}$ in. long. China. Var. *Wolfii*, Rehd., branches partially prostrate, lvs. longer and narrower, fls. carmine.

15. *L. cærulea*, L. Variable branching erect or spreading shrub to 5 ft., branchlets glabrous or pubescent when young: lvs. oval, obovate or oblong, $\frac{1}{2}$ -3 in. long, rounded at apex, pale or glaucous-green, pubescent or nearly glabrous, often stipulate: fls. twin, yellowish or greenish-white, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, axillary, short-peduncled, produced in spring; corolla-tube gibbous at base, the limb nearly regular; ovaries united, commonly exceeded by the subulate or linear bracts: fr. blue, bloom-covered, consisting of the 2 berries connate at base and wholly covered by the connate bractlets, hence seemingly connate throughout. N. Eu., N. Asia; nat. in N. Amer.

16. *L. nitida*, Wils. Evergreen shrub to 6 ft., with upright densely leafy branches; young shoots slender, purplish, sparsely bristly: lvs. ovate to oblong-ovate, $\frac{1}{4}$ - $\frac{1}{2}$ in. long,

obtuse, subcordate to broadly cuneate at base, glossy above, glabrous or nearly so: fls. creamy-white, fragrant, produced in axillary short-stalked pairs: fr. globular, blue-purple, transparent, about $\frac{1}{4}$ in. across, the berries distinct but surrounded by the connate bractlets. W. China.

17. *L. pileata*, Oliv. Evergreen or semi-evergreen spreading shrub, sometimes prostrate: lvs. oval to oblong-lanceolate, $\frac{1}{4}$ – $1\frac{1}{2}$ in. long, obtusish, glabrous or pubescent on midrib beneath, dark green and glossy above, tapering at base, very short-stalked: fls. whitish, fragrant, opening in spring, erect, in pairs on short axillary peduncles; corolla funnelliform, $\frac{1}{2}$ in. long, the tube gibbous at base, limb nearly regular; stamens exserted: fr. a translucent purple color, $\frac{1}{2}$ in. wide, surrounded by a cupule formed by the connate bractlets and invested at top by a curious outgrowth of the calyx. China.

18. *L. Standishii*, Jacques. Semi-evergreen shrub to 8 ft., the spreading branches with reflexed bristly hairs: lvs. oblong-ovate to ovate-lanceolate, 3–4 in. long, acute or acuminate, sparsely hispid: fls. creamy-white or slightly blushed, very fragrant, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, borne in pairs on rather short curved bristly peduncles, often 2 pairs at each joint, Mar.–Apr.; corolla bilabiate, usually bristly outside: fr. red, the 2 ovaries united nearly to the top and forming a berry, early June. (Named for the nurseryman who grew many of Fortune's collections.) China.

19. *L. fragrantissima*, Lind. & Paxt. Shrub to 8 ft., deciduous or evergreen, glabrous except for the lf.-margins and midrib: lvs. rather stiff and leathery, broadly oval, 1–3 in. long, short-stalked, strongly apiculate, dull dark green above, rather glaucous beneath: fls. creamy-white, very fragrant, $\frac{5}{8}$ in. long, several pairs in an axil, on short glabrous peduncles, Mar.–Apr.; corolla 2-lipped, glabrous outside: fr. as in *L. Standishii*. China.

20. *L. quinquelocularis*, Hardw. Shrub to 15 ft., young shoots very downy: lvs. ovate or oval, 1–3 in. long, mostly acuminate, rounded or tapered at base, short-petioled, slightly pubescent: fls. creamy-white becoming yellow, borne in axillary pairs on peduncles about equalling the petioles; corolla 2-lipped, $\frac{3}{4}$ in. long, the tube somewhat swollen; stamens about as long as the upper lip, pubescent at base: fr. translucent white, globose to ovoid. W. Asia.

21. *L. Maackii*, Maxim. Spreading upright shrub to 15 ft., the branchlets short-pubescent: lvs. elliptic-ovate to ovate-lanceolate, $1\frac{1}{2}$ –3 in. long, acuminate, narrowed at base, dark green, pubescent on veins, short-petioled: fls. fragrant, pure white becoming yellowish with age, in axillary pairs on peduncles shorter than the petioles, in June; corolla $\frac{3}{4}$ in. long, bilabiate, the upper lip erect with outer clefts deeper than the middle, the tube short and not gibbous, usually glabrous outside; stamens about twice as long as corolla-tube, downy at base; style hairy: fr. dark red, the berries distinct. (Named for Richard Maack, page 563.) Asia. Var. *podocarpa*, Franch., of more spreading habit, lvs. more pubescent, corolla smaller and pubescent outside.

22. *L. tatarica*, L. TATARIAN HONEYSUCKLE. Deciduous bushy glabrous shrub reaching 10 ft.: lvs. ovate to oblong-ovate, $1\frac{1}{2}$ – $2\frac{1}{2}$ in. long, pale green beneath: fls. pink, crimson or white, $\frac{3}{4}$ –1 in. long, in pairs on slender axillary peduncles, May–June; corolla bilabiate, glabrous without, hairy within, the upper lip with outer lobes distinct, the tube gibbous at base, much shorter than the spreading or reflexed oblong lobes; ovaries distinct, subtended by the small bractlets, these distinct or connate at base: fr. red, rarely yellow. Russia to Turkestan. Var. *alba*, Loisel., fls. pure white. Var. *grandiflora*, Rehd., fls. larger, white. Var. *latifolia*, Loud., lvs. to 4 in. long and 2 in. across, fls. pink. Var. *rosea*, Regel, fls. rose outside, pink inside. Var. *sibirica*, Pers. (var. *rubra*, Sweet), fls. deep pink.—*L. bella*, Zabel, is a hybrid between *L. Morrowii* and *L. tatarica*, lvs. nearly glabrous, corolla glabrous on outside, pink or white fading to yellowish; color variants are known as *L. bella albidæ*, *candida* and *rosea*.

23. *L. Korolkowii*, Stapf. Deciduous shrub to 12 ft., with spreading branches pubescent when young: lvs. ovate or oval, $\frac{1}{2}$ – $1\frac{1}{2}$ in. long, acute, pubescent on both sides, short-petioled: fls. rose or rarely white, $\frac{1}{2}$ in. long, in axillary long-peduncled pairs in May–June; corolla 2-lipped, glabrous outside, tube slightly gibbous at base: fr. bright red. (Named for Colonel Korolkow of Moscow.) Turkestan. Var. *floribunda*, Nichols., lvs. broad-ovate. Var. *Zabelii*, Rehd. (*L. Zabelii*, Rehd.), lvs. glabrous, broad-ovate.—A hybrid between this species and *L. tatarica* is *L. amœna*, Zabel, with ovate slightly pubescent lvs. and pink or white fls. $\frac{3}{4}$ in. long.

24. *L. Ruprechtiana*, Regel. To 12 ft.: lvs. ovate-lanceolate to lanceolate, 2–4 in. long, acuminate, commonly dark green above, grayish-pubescent beneath: fls. twin, on peduncles longer than the petioles, May–June; corolla 2-lipped, pure white changing to yellowish, about $\frac{1}{2}$ in. long, tube gibbous, glabrous outside: fr. red or sometimes yellow. (F. J. Ruprecht, page 50.) Manchuria, N. China.—A hybrid between this species and *L. tatarica* is *L. notha*, Zabel, nearly glabrous, fls. pinkish fading to yellowish.

25. *L. Morrowii*, Gray. Deciduous shrub to 8 ft., with wide-spreading branches: lvs. oval or oblong-ovate, 1– $2\frac{1}{2}$ in. long, acute or obtusish, grayish-tomentose beneath: fls. $\frac{1}{2}$ in. long, twin, on slender axillary peduncles exceeding the petioles in May–June; bractlets distinct, about as long as the ovary; corolla 2-lipped, downy, creamy-white, becoming

yellow in age, the slender tube slightly swollen at base, the spreading spatulate lobes twice as long as tube; stamens glabrous: fr. blood-red, berries distinct. (Named for a famous traveller in Japan; page 163.) Japan.

26. *L. chrysantha*, Turcz. Erect shrub to 12 ft., with pilose rarely glabrous branchlets: lvs. rhombic-ovate to rhombic-lanceolate, 2-5 in. long, acuminate, pilose or above nearly glabrous: fls. yellowish-white changing to yellow, in pairs on hairy axillary peduncles longer than the petioles in May-June; bractlets distinct, ovate, one-third to one-half as long as the ovary; corolla $\frac{1}{2}$ - $\frac{3}{4}$ in. long, slightly pubescent outside, the upper lip cleft about one-half, the short tube strongly gibbous; stamens pubescent below middle: fr. coral-red, the berries distinct. N. E. Asia to Cent. Japan.

27. *L. Xylosteum*, L. EUROPEAN FLY HONEYSUCKLE. Deciduous shrub to 10 ft., very bushy, young shoots downy: lvs. ovate to obovate, 1-2½ in. long, acute or obtuse, glabrous or sparsely pubescent above, more densely pubescent beneath: fls. yellowish-white or reddish-tinged, in pairs on axillary peduncles longer than the petioles in May-June; bractlets pubescent, suborbicular, about half as high as the ovary; corolla very downy, conspicuously 2-lipped, the tube short and gibbous; stamens well-exserted, pubescent at base: fr. dark red, berries distinct. (*Xylosteum*: Greek *wood* and *bone*, in allusion to the hardness of the wood, an herbalist name.) Eu., Asia, sometimes escaped from cult.—A hybrid with *L. tatarica*, known as *L. xylosteoides*, Tausch. (*L. nepalensis*, Kirchn.), has rhombic-ovate bluish-green lvs. and small pinkish fls.

6. LINNÆA, L. One evergreen trailing subshrub useful for the rock-garden.—Lvs. opposite, petioled, without stipules: fls. in pairs at ends of long terminal peduncles; calyx 5-parted; corolla 5-lobed, campanulate or funnelform; stamens 4, inserted near base of corolla-tube; ovary 3-celled, but only 1 cell fertile and 1-ovuled; stigma slender: fr. an ovoid achene. (Linnaea: named for Linnaeus by Gronovius.)

L. borealis, L. TWIN-FLOWER. Lvs. roundish, $\frac{1}{4}$ -1 in. long, with few teeth, usually ciliate and slightly hairy above: fls. white or rose, fragrant, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, on peduncles 2-3 in. long, in summer: fr. yellow, $\frac{1}{2}$ in. long. N. Eu., N. Asia, Alaska. Var. *americana*, Rehd. (*L. americana*, Forbes), lvs. usually glabrous, fls. more tubular and to $\frac{1}{2}$ in. long; N. Amer.

7. KOLKWTZIA, Graebn. Handsome deciduous shrub, 1 Chinese species.—Lvs. opposite, short-petioled, without stipules: fls. in axillary pairs forming terminal corymbs; calyx 5-parted; corolla 5-lobed, campanulate; stamens 4; ovaries 2, each 3-celled but only 1 cell fertile and 1-ovuled: fr. a bristly achene. (Kolkwit-zia: named for Richard Kolkwitz, born 1873, professor of botany in Berlin.)

K. amabilis, Graebn. BEAUTY-BUSH. To 8 ft.: lvs. ovate, 1-3 in. long, acuminate, slightly toothed, ciliate and hairy at least on veins: fls. pink with yellow throat, $\frac{1}{2}$ in. long, in corymbs 2-3 in. across in May-June; pedicels and sepals bristly: fr. ovoid, $\frac{1}{4}$ in. long, covered with bristles.

8. ABELIA, R. Br. Over 25 species in E. and Cent. Asia, 1 in the Himalayas and 2 in Mex., several planted for ornament.—Small or medium-sized bushy shrubs with deciduous or persistent foliage: lvs. opposite, short-petioled, entire or dentate: fls. rather small but numerous, varying from white to pink or purple, in 1- to several-fld. cymes, axillary or terminal on short branchlets, sometimes forming panicles at the ends of the branches; calyx with 5 (rarely 2-4) elongate segms. usually purplish and conspicuous, persistent after the corolla has fallen; corolla tubular, campanulate or salverform, the limb equally 5-lobed; stamens 4, paired, inserted on the base of the corolla-tube; ovary 3-celled, only 1 cell fertile: fr. a 1-seeded leathery achene, crowned by the persistent calyx. (Abe-lia: bears the name of Dr. Clarke Abel, 1780-1826, physician and author on China.)

- | | |
|--|-------------------------|
| A. Fls. axillary, 1½-2 in. long..... | 1. <i>A. floribunda</i> |
| AA. Fls. in terminal panicles, ½-1 in. long..... | |
| B. Corolla salverform..... | 2. <i>A. triflora</i> |
| BB. Corolla campanulate or funnelform..... | |
| C. Sepals 2..... | 3. <i>A. Schumannii</i> |
| CC. Sepals 5..... | 4. <i>A. chinensis</i> |

1. *A. floribunda*, Decne. (*Vesalea floribunda*, Martens & Galeotti). Evergreen shrub 6-10 ft. high, young branches downy: lvs. oval or ovate, $\frac{3}{4}$ -1½ in. long, acute or obtusish, shallowly toothed, glossy-green, hairy only on the margin: fls. pendulous, 1-3 at or near the ends of short twigs, in summer; sepals 5, green; corolla carmine-purple, tubular narrowing toward base, 1½-2 in. long, with 5 rounded spreading lobes; stamens hairy. Mex.

2. *A. triflora*, R. Br. Deciduous upright shrub to 12 ft.: lvs. lanceolate or ovate-

lanceolate, 1-3 in. long, long-acuminate, entire or with few large teeth, somewhat hairy: fls. rosy-white, fragrant, in terminal clusters 2 in. across in June; sepals 4-5; corolla salverform, with slender pubescent tube $\frac{1}{2}$ in. long and spreading lobes about $\frac{1}{2}$ in. across. Himalayas.

3. *A. Schumannii*, Rehd. (*Linnaea Schumannii*, Graebn.). Slender deciduous shrub 5 ft. or more high: lvs. ovate or oval, $\frac{1}{2}$ -1 in. long, obtuse and mucronate, entire or slightly toothed, pubescent on midrib beneath: fls. pink, several borne at ends of short side growths, in summer; sepals 2; corolla campanulate, about $\frac{3}{4}$ in. long, somewhat glandular-pubescent outside. (Named for K. M. Schumann, page 51.) China.

4. *A. chinensis*, R. Br. (*A. rupestris*, Lindl.). Deciduous shrub 3-6 ft. high, of spreading habit, young branches minutely reddish-downy: lvs. ovate, $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long, acute or short-acuminate, rounded at base, serrate, more or less hairy above and on the midrib beneath: fls. white, fragrant, in dense terminal panicles in summer; sepals 5, rosy-tinted; corolla funnelform, $\frac{1}{2}$ in. long; stamens exserted. China.—The most commonly cult. abelia is *A. grandiflora*, Rehd. (*A. rupestris* var. *grandiflora*, André), a hybrid between *A. chinensis* and *A. uniflora*; half-evergreen; lvs. shining; panicles dense, sepals 2-5 and more or less connate, stamens not exserted.

9. **DIERVILLA**, Adans. BUSH-HONEYSUCKLE. Deciduous stoloniferous shrubs; 3 species in N. Amer.—Lvs. opposite, mostly petioled, serrate: fls. in small leafless axillary clusters that are sometimes aggregated into terminal cymes, in summer, yellow or greenish-yellow; calyx 5-parted, mostly persistent; corolla 2-lipped, the tube funnelform; stamens 5, exserted; ovary 2-celled, style exserted, stigma capitate: fr. a slender 2-valved caps. with numerous minute seeds. (Diervilla: after N. Dierville, a French surgeon who took *D. Lonicera* to Eu. early in the 18th century.)

- A. Branchlets and lvs. pubescent.....1. *D. rivularis*
- AA. Branchlets and lvs. glabrous.
- B. Lvs. distinctly petioled.....2. *D. Lonicera*
- BB. Lvs. sessile.....3. *D. sessilifolia*

1. *D. rivularis*, Gatt. To 6 ft., branches terete and densely pubescent: lvs. ovate to oblong-lanceolate, 2-3 in. long, acuminate, nearly sessile, pubescent on both sides: cymes several-fld., crowded into terminal panicles; corolla lemon-yellow, limb about equalling tube: caps. $\frac{1}{4}$ in. long. N. C., Tenn., Ga., Ala.

2. *D. Lonicera*, Mill. (*D. trifida*, Moench. *D. canadensis*, Willd.). Spreading, 2-4 ft. high, branchlets nearly terete, glabrous: lvs. ovate or ovate-oblong, $1\frac{1}{2}$ -4 in. long, acuminate, distinctly petioled, nearly glabrous, finely ciliate: axillary cymes commonly 3-fld., terminal ones 3-5-fld.; corolla yellow or in age darker, tube $\frac{1}{2}$ in. long, limb nearly as long and sometimes irregular, 3 of the lobes more united, the middle one deeper yellow and villous on the face; style and stamens hairy below: caps. about $\frac{1}{2}$ in. long, oblong, with a slender beak, crowned with the calyx-lobes. Newf. to Sask. south to N. C.

3. *D. sessilifolia*, Buckl. To 5 ft., branchlets quadrangular and glabrous: lvs. ovate-lanceolate, 2-6 in. long, gradually acuminate, sessile, nearly glabrous, of firmer texture: cymes 3-7-fld., often crowded into dense terminal panicles; corolla sulfur-yellow, the limb shorter than tube, lobes nearly equal, one of them obscurely pilose: caps. $\frac{1}{2}$ - $\frac{1}{2}$ in. long, short-oblong, short-necked, crowned with short lanceolate-subulate calyx-lobes. N. C., Tenn., Ga., Ala.

10. **WEIGELA**, Thunb. Showy shrubs frequently planted in many forms, of 10-12 species in E. Asia.—Formerly included in Diervilla but quite distinct: not stoloniferous: fls. on short leafy shoots of the season, large, pink, purplish to carmine or white, not 2-lipped although corolla-lobes often unequal: caps. long and narrow, woody, dehiscing by 2 valves from the top, leaving a central column. (Named for C. E. Weigel, 1748-1831, German professor.)

- A. Calyx divided about to middle into lanceolate lobes: seeds not winged.
- B. Lvs. pubescent on both sides.....1. *W. præcox*
- BB. Lvs. glabrous above, pubescent only on veins beneath.
- C. Corolla abruptly contracted below middle.....2. *W. florida*
- CC. Corolla gradually contracted into slender tube.....3. *W. venusta*
- AA. Calyx divided to base into linear lobes: seeds winged.
- B. Lvs. and branchlets glabrous.....4. *W. coræensis*
- BB. Lvs. and branchlets pubescent.
- C. Caps. pubescent: style much-exserted.....5. *W. floribunda*
- CC. Caps. glabrous: style not or slightly exserted.
- D. Corolla gradually widening upwards: lvs. pubescent mostly on veins beneath.....6. *W. japonica*
- DD. Corolla abruptly expanded above middle: lvs. densely pubescent beneath.....7. *W. hortensis*

1. *W. præcox*, Bailey (*Diervilla præcox*, Lemoine). To 6 ft., with glabrous or hairy branchlets: lvs. elliptic or elliptic-ovate, 2-3½ in. long, acuminate, short-petioled, serrate, hairy above, soft-pubescent beneath: fls. in clusters of 3-5, nodding, in early spring; calyx with subulate lobes about as long as tube, very hairy; corolla 1½ in. long, abruptly narrowed below the middle, purplish-pink or rose-carmine, pubescent outside: caps. glabrous. Korea.—The earliest of all species to bloom; has given rise to a race of early-blooming hybrids.

2. *W. florida*, A. DC. (*Diervilla florida*, Sieb. & Zucc. *D. pauciflora*, Carr. *W. rosea*, Lindl. *W. amabilis*, Hort.). Spreading shrub to 6 ft., branchlets with 2 hairy stripes: lvs. elliptic or ovate-oblong to obovate, 2-4 in. long, long-pointed, short-petioled or nearly sessile, serrate except toward base, glabrous above except at the midrib, tomentose on the veins beneath: fls. often in terminal 3's or 4's on short lateral twigs, May-June; calyx nearly glabrous, with 5 lanceolate lobes nearly as long as the tube; corolla funnel-shaped, 1¼ in. long, downy and deep rose outside, paler within, the limb 1 in. across, with 5 spreading rounded lobes; stigma 2-lobed: caps. glabrous. N. China, Korea. Var. *variegata*, Bailey (*Diervilla florida* var. *variegata*, Bean), lvs. margined with yellowish-white.—Names associated with this species and allegedly hybrids between it and *W. hortensis* or *W. corænsis* include *Steltzeri*, *Vanhouttei*, *Eva Rathke* and *Mont Blanc*. The plant known as *W. candida* is probably a white-fl. form of *W. florida* (forma *alba*, Rehd. *W. rosea alba*, Moore).

3. *W. venusta*, Bailey (*W. florida* var. *venusta*, Nakai. *Diervilla venusta*, Stapf). Differs from *W. florida* in the smaller nearly glabrous lvs., rose-purple fls. which are gradually contracted into a slender tube and small lobes, calyx small and 2-lipped. Korea.

4. *W. corænsis*, Thunb. (*Diervilla corænsis*, DC. *D. grandiflora*, Sieb. & Zucc. *D. amabilis*, Carr.). Vigorous shrub 5-15 ft. high, nearly glabrous: lvs. broadly ovate to elliptic, 3-4 in. long, abruptly acuminate, crenate-serrate, glabrous or sparingly hairy on veins beneath and on petioles: fls. in 1-3-fl. peduncled cymes in May-June; calyx divided to base into linear lobes; corolla 1¼ in. long, broadly funnelform abruptly narrowed below the middle, changing from whitish or pale pink to carmine, glabrous; stigma capitate: caps. glabrous. Japan.

5. *W. floribunda*, Mey. (*Diervilla floribunda*, Sieb. & Zucc.). To 10 ft., branches slender, soft-hairy: lvs. ovate or oval, 3-4 in. long, acuminate, short-petioled, narrowed at base, serrate, pubescent on both surfaces especially the lower: fls. mostly sessile, usually crowded at ends of short branchlets, in May-June; calyx divided to base into linear lobes; corolla 1 in. long, funnelform, rather gradually narrowed toward base, with 5 spreading lobes about one-fifth as long as tube, pubescent outside, dark almost blood-red; style well-exserted, stigma capitate: caps. pubescent. Japan.—Names belonging to this group are *Desboisii*, *Hendersonii*, *Abel Carrière*, the two latter probably hybrids with *W. florida*.

6. *W. japonica*, Thunb. (*Diervilla japonica*, DC.). To 10 ft., branchlets nearly glabrous: lvs. oblong-obovate or elliptic, 2-4 in. long, acuminate, serrate, sparingly pubescent above, pubescent on veins beneath: fls. usually in 3-fl. short-peduncled cymes, often crowded at ends of short branchlets, May-June; calyx divided to base, hairy; corolla 1-1¼ in. long, broadly funnelform, gradually narrowed below the middle, whitish at first changing to carmine, slightly pubescent or nearly glabrous outside; style somewhat exserted: caps. glabrous. Japan.

7. *W. hortensis*, Mey. (*Diervilla hortensis*, Sieb. & Zucc. *D. japonica* var. *hortensis*, Rehd.). Differs from *W. japonica* in more pubescent branchlets, lvs. densely tomentose beneath, longer-peduncled cymes, corolla abruptly expanded above middle and pubescent outside. Japan.

189. VALERIANACEÆ. VALERIAN FAMILY

Herbs and sometimes shrubs of wide distribution, most abundant in the northern hemisphere; about 9 genera and 300 species, some grown for ornament and for food.—Lvs. opposite, without stipules: fls. small, bisexual or unisexual, in cymose or capitate clusters; corolla usually 5-merous as to envelopes, gamopetalous and epigynous, somewhat irregular, often spurred or swollen at base, bearing 1-3 rarely 4 stamens on its tube and alternate with lobes; ovary inferior, invested by the calyx-tube, 1-3-celled, one of the cells with a single ovule, the others empty: fr. a kind of achene, indehiscent.

- A. Lvs. (in ours) pinnatisect. 1. VALERIANA
 AA. Lvs. not pinnatisect.
 B. Fr. 1-celled: stamen 1. 2. CENTRANTHUS
 BB. Fr. 3-celled: stamens 2-3.
 c. Stamens 3: fr. about ¼ in. long. 3. VALERIANELLA
 cc. Stamens 2: fr. ½-¾ in. long. 4. FEDIA

Fig. 189. VALERIANACEÆ. *Valeriana officinalis*: a, portion of inflorescence, $\times \frac{1}{2}$; b, flower, $\times 3$; c, same, vertical section, $\times 4$; d, leaf, $\times \frac{1}{4}$.

1. **VALERIANA**, L. VALERIAN. Genus of some 175 species, mostly in the temp. and colder regions of the northern hemisphere, one planted in fl.-gardens and borders. —Commonly glabrous herbs, subshrubs or shrubs, erect or scandent, with strong-smelling roots and often with very fragrant fls.: lvs. entire or dentate or 1-3-pinnatisect: cymes few-fl'd. and terminal or in dense or interrupted spikes or variously paniced; fls. small, white or rose, in ours bisexual; calyx-limb of 5-15 lobes inconspicuous before fruiting, then unrolling and forming a kind of plumose pappus; corolla-tube attenuate at base, limb 5-cleft; stamens 3, rarely 1 or 2; fr. a compressed achene, the rear face 1-nerved, the front face 3-nerved. (Valeria-na: Latin *to be strong*, in allusion to medicinal uses.)

V. officinalis, L. COMMON VALERIAN. GARDEN-HELIOTROPE. Per. to 5 ft., glabrous or below pubescent; rhizome truncate, sometimes stoloniferous; sts. erect, simple or above somewhat branched, grooved: lvs. all pinnatisect into 7-10-paired, entire or dentate-serrate, ovate-oblong or lanceolate segms., those of the upper lvs. acuminate: corymb broadly paniculate, long-branched; fls. small, numerous, very fragrant, whitish, pinkish or lavender, in the vars. white or red. Eu., N. Asia; frequent in old gardens and also escaped.

2. **CENTRANTHUS**, DC. (or *Kentranthus*). CENTRANTH. About a dozen species in the Medit. region, grown for ornament. —Ann. or per. herbs or sometimes half shrubby: lvs. entire, dentate or pinnatisect: fls. small, red or white, in dense terminal clusters; calyx cut into 5-15 narrow divisions, enlarging after flowering; corolla slender-tubed, 5-parted, spurred at base; stamen 1: fr. 1-celled, crowned with a pappus-like crest. (Centran-thus: Greek *spurred flower*.)

A. Plant per.: lvs. mostly entire.....1. *C. ruber*
AA. Plant ann.: lvs. toothed or lobed.....2. *C. macrosiphon*

1. **C. ruber**, DC. (*Valeriana rubra*, L. *V. coccinea*, Hort.). RED VALERIAN. JUPITERS-BEARD. Smooth and glaucous per., 1-3 ft. high, somewhat woody at base, forming a compact floriferous bushy plant: lvs. ovate to lanceolate, to 4 in. long, sessile and very broad at base or tapering to petiole, entire or sometimes toothed at base: fls. numerous, fragrant, deep crimson to pale red (or white in var. *albus*), about $\frac{1}{2}$ in. long, the spur slender. Eu. to S. W. Asia.

2. **C. macrosiphon**, Boiss. Ann. cult. in rockeries and borders, 1-2 ft. high: lvs. ovate, $\frac{1}{2}$ -3 in. long, some sessile, others very long-petioled, toothed or lobed, glaucous: fls. deep rose, about $\frac{1}{2}$ in. long. Spain.—There are white-fl'd. and dwarf forms.

3. **VALERIANELLA**, Mill. Some 50 or more species of the northern hemisphere, mostly in the Medit. region, two grown in the vegetable-garden. —Ann. dichotomously branched herbs, glabrous or nearly so except the fr. and lf.-bases: lvs. of basal rosette entire; st.-lvs. entire, dentate or rarely incise-pinnatifid: fls. whitish, pale bluish or rose, in cymes which are sometimes corymbosely paniculate-fastigiate, or sometimes densely globose at the ends of the branches; corolla-tube short or rarely elongate, with or without sac or spur, limb 5-cleft and spreading; stamens 3, rarely 2: fr. 3-celled, 2 cells empty. (Valerianel-la: diminutive of Valeriana.)

A. Fr. with empty cells as large as fertile one and its corky back: basal lvs. (including petiole) 2-3 in. long.....1. *V. olitoria*
AA. Fr. with empty cells much narrower than fertile one: basal lvs. (including petiole) 3-5 in. long.....2. *V. eriocarpa*

1. *V. olitoria*, Poll. (*V. Locusta* var. *olitoria*, L. *V. Locusta*, Beteke). CORN-SALAD. Small nearly glabrous branching ann. to 1 ft., in Eu. growing among the corn (grain), whence the name "corn-salad": basal lvs. abundant and tufted, spatulate or oblong, toothed or entire, obtuse, 2-3 in. long including petiole; st.-lvs. similar, successively smaller, sometimes toothed: fls. very small, light blue, 5-lobed, in dense heads terminating forking branches: fr. ("seed") nearly orbicular, but with a short 2-pointed beak, flattened sidewise, $\frac{1}{4}$ in. long, the 2 empty cells as large as the fertile one and its corky back. Eu.; nat. in N. Amer.

2. *V. eriocarpa*, Desv. ITALIAN CORN-SALAD. Distinguished from the preceding by having lvs. 3-5 in. long (including petiole): seed flattened, convex on one side, hollowed on the other, surmounted by the obliquely truncate corolla-like calyx-limb, the empty cells very much narrower than the fertile one. S. Eu.

4. **FEDIA**, Moench. A single species of the Medit. region, grown as an ornamental and also somewhat as a salad plant.—Glabrous branching ann.: lvs. entire or dentate: fls. small, red, in more or less dense terminal cymes; peduncles thick and hollow; corolla-tube elongate, limb 2-lipped, the 5 lobes unequal; stamens 2; style entire or 2-3-fid: fr. with the 2 empty cells narrower than the fertile one. (Fe-dia: application doubtful.)

F. Cornucopiæ, DC. (*Valeriana Cornucopiæ*, L. *F. scorpioides*, Dufr. *Mitrophora Cornucopiæ*, Kuntze). AFRICAN VALERIAN. Sts. stout, densely leafy, usually purplish, 10-16 in. long: lvs. ovate-spatulate, $1\frac{1}{2}$ -4 in. long, shining green: fr. $\frac{1}{8}$ - $\frac{3}{4}$ in. long, in shape somewhat resembling a grain of wheat. (Cornucopiæ: cornucopia-like.)

FIG. 190. DIPSACEÆ. A, *Scabiosa atropurpurea*: Aa, flowering branch, $\times \frac{1}{2}$, and leaf, $\times \frac{1}{4}$; Ab, flower, $\times 2$; Ac, same, vertical section, $\times 2$; Ad, fruit, $\times 2$. B, *Dipsacus sylvestris*; fruiting inflorescence, $\times \frac{1}{4}$.

190. DIPSACEÆ. TEASEL FAMILY

Per., bien. or ann. herbs of the Old World, a few cult. for commercial or ornamental purposes; about 11 genera and 160 species.—Lvs. opposite or rarely whorled, entire, toothed or pinnatifid: fls. small, in dense bracted and involucrate heads or in interrupted spikes; calyx-tube adnate to the 1-celled simple ovary; stamens inserted on corolla-tube and alternate with its lobes, of the same number or fewer, distinct; ovary inferior, 1-celled, style filiform, stigma simple, ovule 1: fr. an achene.

- | | |
|---|------------------|
| AA. Plant spiny and thistle-like. | |
| B. Fls. in dense heads | 1. DIPSACUS |
| BB. Fls. in interrupted spikes | 2. MORINA |
| AA. Plant not spiny. | |
| B. Involucral bracts rigid, in several series and overlapping | 3. CEPHALARIA |
| BB. Involucral bracts herbaceous, in 1-2 series. | |
| cc. Calyx of 5 setæ, persistent | 4. SCABIOSA |
| cc. Calyx of 10 or more setæ, often deciduous | 5. PTEROCEPHALUS |

1. **DIPSACUS**, L. TEASEL. About 15 species in Eu., N. Afr. to Abyssinia and Asia, one of commercial value.—Prickly or rough-hairy stout biennials: cauline lvs. mostly connate and cup-like at base: fls. in a terminal head or short spike with involucre bracts and those of the receptacle sharp or spine-tipped; calyx-limb cup-like, 4-toothed or -lobed; corolla 4-lobed, nearly regular; stamens 4; stigma lateral: fr. an achene adnate to and inclosed by the calyx-like involucre. (Dip-sacus: Greek *thirst*, because the connate lf.-bases in some species hold water.)

D. fullonum, L. (*D. sativus*, Honckeney). FULLERS TEASEL (fullonum, of the fullers). To 6 ft. high, sts. prickly: lvs. lanceolate or oblong, to 1 ft. long, entire or toothed, prickly on midrib beneath: fls. pale lilac, in cylindric heads 2-4 in. long, on long prickly peduncles; bracts of involucre usually shorter than head, at length reflexed; bracts of receptacle with recurved spine-tipped apex. An escape from Eu. about wool mills in the eastern and middle states.—Cult. for the "teasels" or ripe heads which are used by machinery for fulling (raising the nap) on woolen cloth. *D. sylvestris*, Huds., differs in bracts of receptacle tipped with a straight barbed awn; nat. in E. U. S. from Eu. and Asia.

2. MORINA, L. Thistle-like perennials, one sometimes raised for ornament; about 10 species native to Asia.—Lvs. mostly spinose-toothed: fls. whorled in spikes, with wide spinose-toothed lf.-like bracts and with spinose bracteoles among the fls., the lower whorls distant; calyx 2-lipped, the lips entire or 2-lobed; corolla 5-lobed, somewhat 2-lipped, the tube curved, in ours long; stamens 2 or 4, with sometimes a sterile one. (Mori-na: after Louis Morin, 1636-1715, a French botanist.)

M. longifolia, Wall. WHORL-FLOWER. Per. with stout sts. pubescent above, 3-4 ft. high: foliage thistle-like; lvs. narrowly oblong or linear, 6 in. and more long, 1 in. wide: fls. showy, deepening from white in the bud to pink and finally crimson, the uppermost whorls densely crowded; calyx-lobes unequal, 2-lobed with obtuse not spinose lobes; corolla-tube $1\frac{1}{4}$ in. long; fertile stamens 2, the filaments much shorter than the corolla-lobes. Himalayas, 9,000-14,000 ft.

3. CEPHALARIA, Schrad. Plants of the Medit. region, N. and S. Afr. and W. Asia, also in Abyssinia; about 30 species, somewhat planted for ornament.—Coarse ann. or per. herbs: lvs. entire or pinnate: bloom somewhat like that of Scabiosa; heads terminating long peduncles, ovoid or globular, bearing many 4-parted yellowish, whitish, or bluish florets; involucre of several series of overlapping stiff bracts: stamens 4, perfect: fr. a 4-8-ribbed achene, the calyx-border often remaining on its summit. (Cephala-ria: Greek *head*, alluding to the capitate fl.-clusters.)

A. Marginal fls. enlarged and radiating.....1. *C. tatarica*
AA. Marginal fls. not so.....2. *C. alpina*

1. C. tatarica, Schrad. Per. to 6 ft. or more, the sts. retrorse-hairy below and nearly naked above: lvs. pinnatisect into oblong or oval-lanceolate toothed segms. decurrent on petiole, nearly glabrous above, hairy beneath as also the petiole: fls. cream or yellow, in rather flat heads to 2 in. across, the marginal fls. enlarged and radiating; involucre bracts ovate, obtuse or acute, hairy. Russia, W. Asia.

2. C. alpina, Schrad. Evidently not in cult., the plant grown under this name being *C. tatarica*; differs in sts. velutinous, lf.-segms. lanceolate, marginal fls. not conspicuously enlarged, involucre bracts acuminate and silky-hairy. Mts. of S. Eu.

4. SCABIOSA, L. SCABIOUS. MOURNING BRIDE. PINCUSHION-FLOWER. Herbs, of about 80 species in Eu., Asia and Afr., rare in the tropics; a few popular fl.-garden plants.—Ann. or per., more or less woody at base: lvs. entire, dentate, lobed or dissected: heads depressed subglobose or ovoid-conical, terminating long peduncles or rarely dichotomously sessile; bracts of the involucre 1-2-rowed, herbaceous; fls. blue, rose, yellowish or white, the marginal fls. usually larger and radiating; calyx bristly, of 5 setæ united at base; outer calyx or involucre adnate to achene, with free cup-like limb; corolla-limb 4-5-cleft, subequal or oblique or 2-lipped; stamens 4, rarely 2; ovary inferior, crowned with persistent calyx. (Scabio-sa: Latin *itch*, referring to medicinal use.)

A. Lvs. all linear and entire.....1. *S. graminifolia*
AA. Lvs. not linear, some of them lobed or cut.
B. Limb of involucre crenate and inflexed: plant ann.....2. *S. atropurpurea*
BB. Limb of involucre erect and cup-like: plant per.
C. Involucels terete, with 5 deep pits below the limb.....3. *S. caucasica*
CC. Involucels 8-grooved the entire length, without deep pits.
D. Fls. yellowish-white.....4. *S. ochroleuca*
DD. Fls. lilac or blue.
E. Basal lvs. toothed or lyrate-pinnatifid.
F. Sts. and lvs. usually glabrous: calyx-setæ distinctly keeled.....5. *S. lucida*
FF. Sts. and lvs. usually hairy: calyx-setæ not keeled.....6. *S. Columbaria*
EE. Basal lvs. pinnatisect.
F. Corolla 4-lobed.....7. *S. japonica*
FF. Corolla 5-lobed.....8. *S. Fischeri*

1. *S. graminifolia*, L. Per. to $1\frac{1}{2}$ ft., with creeping rootstock and ascending pubescent sts. leafy to about middle: lvs. linear, grass-like, entire, hoary-pubescent: fls. lilac or blue, hairy, in heads $1\frac{1}{2}$ –2 in. across; involucre hairy; calyx-setæ slightly longer than the many-nerved limb of the involucre. Eu.

2. *S. atropurpurea*, L. SWEET SCABIOUS. Branching ann. about 2 ft. high, the sts. nearly glabrous: basal lvs. oblong-spatulate, undivided or lyrate, coarsely dentate; st. lvs. pinnately parted, the oblong lobes dentate or cut; fls. dark purple, rose or white, in long-peduncled heads to 2 in. across, becoming ovate or oblong in fr.; involucre with ribs dilated toward apex, the limb crenate and inflexed, much exceeded by the calyx-setæ. S. Eu.—Very variable in size, habit and color of fls., the different forms being among the most popular fl.-garden annuals.

3. *S. caucasica*, Bieb. Hardy per. $1\frac{1}{2}$ – $2\frac{1}{2}$ ft. high, the sts. glabrous or slightly pubescent: basal lvs. oblong, attenuate into long petiole, entire or sometimes pinnatisect, the upper cut and divided into linear segms.: fls. light blue, in flattish heads to 3 in. across; basal portion of involucre clothed with long dense matted gray hairs; involucre with 5 deep pits below the many-nerved limb, the calyx-setæ about twice as long as limb. Caucasus. Var. *alba*, Hort., fls. white. Var. *goldingensis*, Hort., fls. deep lavender, large. Var. *perfecta*, Hort., fls. large and fringed.

4. *S. ochroleuca*, L. Per. or bien. $1\frac{1}{2}$ – $2\frac{1}{2}$ ft. high, the sts. pubescent and branched: basal lvs. lyrate or sometimes undivided, the upper 1–2-pinnate into linear-lanceolate segms., grayish-pubescent: fls. yellowish-white, in heads $\frac{3}{4}$ – $1\frac{1}{2}$ in. across, the involucre densely pubescent; calyx-setæ two to three times longer than erect limb of involucre. Eu., W. Asia.

5. *S. lucida*, Vill. Per. 1–2 ft. high, sts. glabrous, leafy below: basal lvs. ovate or rhombic, undivided and coarsely toothed or somewhat lyrate, upper 1–2-pinnate into lanceolate or linear segms., glabrous or ciliate: fls. rose-lilac, pubescent outside. $1\frac{1}{2}$ in. across, involucre glabrous; calyx-setæ distinctly keeled, shining dark purple, four to five times longer than limb of involucre. Eu.

6. *S. Columbaria*, L. Per. or bien. $1\frac{1}{2}$ – $2\frac{1}{2}$ ft. high, sts. white-hairy to nearly glabrous: basal lvs. lyrate and crenate, upper 1–2-pinnate into lanceolate or linear segms., usually pubescent: fls. lilac, in heads $\frac{3}{4}$ – $1\frac{1}{2}$ in. across, involucre pubescent; calyx-setæ two to four times as long as limb of involucre or lacking, not keeled. (*Columbaria*: from *columba*, dove; fls. dove-like, bluish.) Eu., W. Asia, Afr.

7. *S. japonica*, Miq. Per. to 2 ft., sts. branched and pubescent: basal lvs. pinnatisect, upper pinnate into linear entire or toothed segms., somewhat pubescent: fls. violet-blue, in heads about 2 in. across, involucre densely pubescent; corolla 4-lobed; calyx-setæ three to four times as long as limb of involucre. Japan.

8. *S. Fischeri*, DC. Per. to $2\frac{1}{2}$ ft., sts. much-branched and nearly glabrous: lvs. all pinnatisect into linear entire segms., nearly glabrous: fls. bluish-purple, in heads $2\frac{1}{2}$ in. across; corolla 5-lobed; calyx-setæ twice as long as limb of involucre. (Named for E. L. Fischer, who collected the seeds.) Dahuria.

5. **PTEROCEPHALUS**, Vaill. Herbs or subshrubs of about 20 species in Eu. and Asia, one planted in rock-gardens.—Differs from *Scabiosa* chiefly in the calyx-setæ being 10 or more, and often deciduous. (*Pterocephalus*: Greek for *wing* and *head*.)

P. parnassii, Spreng. (*Scabiosa Pterocephala*, L.). Per. 3–4 in. high, spreading and making broad patches, densely silky-tomentose: lvs. undivided or lyrate-pinnatifid, crenate, to $1\frac{1}{2}$ in. long; fls. purplish-pink, in heads about 1 in. across standing above foliage; calyx-setæ plumose, three to four times longer than involucre. Mts. of Greece.

191. CUCURBITACEÆ. GOURD FAMILY

As known in cult., tendril-climbing (except in *Ecballium* and a few cultivars of *Cucurbita Pepo*) ann. and per. rapid-growing frost-tender herbs, grown for the edible frs. and for ornament; genera about 90 and species about 700, mostly in trop. regions around the world, some extending into temp. zones.—Sts. mostly soft, glabrous, hairy or prickly: lvs. alternate, broad, usually simple but often deeply cut, sometimes compound: tendrils lateral, simple or branched: fls. unisexual (plants monœcious, sometimes diœcious), regular; calyx adnate to ovary, 5-lobed; petals 5 or corolla gamopetalous and 5-lobed; stamens apparently 3 but really 5 with 2 pairs united, mostly monadelphous by contorted anthers, filaments connate or free; ovary inferior, placentation parietal, ovules many, carpels commonly 3: fr. mostly indehiscent, sometimes a papery bladderly pod, more typically a fleshy berry-like structure (pepo) with a rind and spongy seedy interior.

Fig. 191. CUCURBITACEÆ. A, *Cucurbita Pepo* var. *ovifera*: flowering and fruiting stem, $\times \frac{1}{2}$. B, *Cucurbita maxima*: Ba, staminate flower, perianth removed, $\times \frac{1}{2}$; Bb, style and stigma, $\times 1$; Bc, pistillate flower, vertical section, perianth removed, $\times \frac{1}{2}$; Bd, ovary, cross-section, $\times 1$; Be, fruit, much reduced. C, *Cucurbita Pepo*: fruit, much reduced.

- A. Fr. fleshy, with hard or firm rind, indehiscent, mostly edible.
 B. Pepo many-seeded, with 3 evident cells or compartments.
 c. Corolla bell-shaped and distinctly gamopetalous, 5-lobed to middle or a little more.
 D. Anthers coherent..... 1. CUCURBITA
 DD. Anthers free..... 2. SICANA
 CC. Corolla of 5 petals or parted to base, rotate or open-bell-shaped.
 D. Staminate fls. in racemes..... 3. LUFFA
 DD. Staminate fls. solitary (although perhaps more than 1 in an axil).
 E. Sepals leafy, serrate, reflexed..... 4. BENINCASA
 EE. Sepals small, entire, erect or only spreading.
 F. Tendrils branched.
 G. Lvs. not lobed..... 5. LAGENARIA
 GG. Lvs. pinnatifid..... 6. CITRULLUS
 FF. Tendrils simple..... 7. CUCUMIS
 BB. Pepo with 1 great seed..... 8. SECHIUUM
 AA. Fr. quite otherwise, several- to many-seeded, small berry, pod-like, bladdery, dryish or fleshy, mostly inedible: for the most part ornamental plants.
 B. Corolla bell-shaped, gamopetalous, lobed to middle..... 9. COCCINIA
 BB. Corolla rotate or cup-shaped, lobed to base or of separate petals.
 c. Petals fimbriate..... 10. TRICHOSANTHES
 CC. Petals or corolla not fimbriate.
 D. Peduncle, particularly of staminate fls., bearing a shield-shaped bract (in our species)..... 11. MOMORDICA
 DD. Peduncle of staminate fls. naked.
 E. Staminate fls. solitary..... 12. ABOBRA
 EE. Staminate fls. in racemes or corymbs.
 F. Lvs. compound or parted to base (in ours)..... 13. CYCLANTHERA
 FF. Lvs. simple.
 G. Ovules erect: filaments connate..... 14. ECHINOCYSTIS
 GG. Ovules horizontal: filaments free (separate), but anthers free or coherent.
 H. Tendrils present.
 I. Plant (in ours) dioecious: ovary globular..... 15. BRYONIA
 II. Plant monoecious: ovary elongated..... 16. MELOTHRIA
 HH. Tendrils 0..... 17. ECBALIUM

1. CUCURBITA, L. (*Pepo*, Mill.). PUMPKINS. SQUASHES. About 25 species, ann. and per. (ours ann. or cult. as such), all supposed to be American; grown for the frs., either as esculents or ornaments.—Long-running coarse rough-hairy scabrous monoecious plants with branched tendrils and simple mostly lobed lvs.: fls. solitary in axils in our species, the staminate long-peduncled, large, yellow, the corolla gamopetalous and lobed about half way down; anthers united; ovary 1-celled, with 3-5 placentæ, stigmas 2-lobed, 3-5 in number: fr. a large pepo. (Cucur-bitæ: the Latin name for gourd.)

A. Seeds white or tan-white at dry maturity.

B. Plant harsh, rough or scratchy to the feel, more or less setiferous: lvs. mostly strongly lobed and triangular-pointed, dentate or serrate; peduncle angled, expanded at junction with fr. but seldom flared: seeds thick-edged: tips of floral segms. connivent (bud pointed) in evening preceding anthesis; calyxlobes of st. fl. seldom if ever foliaceous..... 1. *C. Pepo*

- BB. Plant soft or at least not harsh to the feel, not setiferous but variously pilose: lvs. only shallowly if at all lobed, rounded or triangulate, mostly not or only obscurely serrate.
- c. Margin of thin seed at fresh maturity very thin, the hyaline ragged edge often wearing away in seed-packet: lf.-blade broad-ovate to somewhat triangular in outline: tips of floral segms. connivent in bud at evening before anthesis: calyx-lobes of st. fl. often prolonged and foliaceous: peduncle long and furrowed, flared at junction with fr. 2. *C. moschata*
- cc. Margin of plump seed obtuse and more or less elevated: lf.-blade circular to reniform in outline: tips of floral segms. open or spreading in bud at evening preceding anthesis: calyx-lobes of st. fl. not foliaceous: peduncle short and spongy, nearly cylindric, not flared at attachment to fr. 3. *C. maxima*
- AA. Seeds black or brown-black, or with a wide blue-black or cyaneous marginal band.
- B. Mature lvs. deeply lobed with rounded sinuses: seeds uniformly black or brown-black. 4. *C. ficifolia*
- BB. Mature lvs. nearly entire: seeds banded in color. 5. *C. argyrosperma*

1. *C. Pepo*, L. (*C. verrucosa*, L. *C. polymorpha*, Duchesne). FIELD PUMPKIN. Plant with sharp stiff translucent harsh hairs, making it rough or scratchy to the hands, sts. long-running: lvs. stiff and somewhat rigid, erect, triangular or ovate-triangular in outline, 6-12 in. long, pointed, usually prominently lobed and apiculate, margins irregularly sharp-serrate: corolla mostly with erect or spreading pointed lobes, the tube commonly narrow at base and flaring upward; calyx-lobes short and narrow: peduncle strongly angled or cornered and expanding at attachment: fr. large, orange, furrowed, perishable; seeds white, elliptic, with raised obtuse margin, $\frac{3}{4}$ -1 in. long, less than $\frac{1}{2}$ in. broad. (Pepo: ante-Linnæan name for the plant.)—The common field, pie and cattle pumpkin.

Var. *ovifera*, Alef. (*C. ovifera*, L. *C. texana*, Gray). YELLOW-FLOWERED GOURDS. Slender long-running and climbing plant with abundant tendrils: lf.-blades 8 in. or less long, broad-ovate in outline, angled to lobed: fr. small and hard-shelled, bitter and inedible, in many shapes and sizes, used for curiosity and ornament, mostly under 4 or 5 in. thick or long, unicolored or striped.—Here belong Apple, Bell, Bicolor, Egg, Orange, Pear gourds, and many others.

Var. *Melopepo*, Alef. (*C. Melopepo*, L. *C. Pepo* var. *condensa*, Bailey). BUSH SQUASHES and PUMPKINS. SUMMER SQUASHES. Plant covering small space, compact, not running or tendril-bearing: fr. various; seeds usually not much exceeding $\frac{1}{2}$ in. long and often less. Known mostly in two historic fr. forms or subraces: *Melopepo clypeiformis*, Bailey, the flat shield-shaped or scalloped or pattypan squashes; *Melopepo torticollis*, Bailey (*C. Pepo* var. *torticollis*, Alef.), the summer crookneck usually warty squashes, elongated and club-shaped, crooked or hooked at the basal end but sometimes straight (Straightneck).

Var. *medullosa*, Alef. VEGETABLE MARROW. Fr. elongate, 16-18 in. or more and perhaps 6-8 in. thick and of nearly equal thickness throughout, not warted, longitudinal ridges few and low or none, yellowish-green to irregularly striped or cream-color, peduncle angled and somewhat expanded at attachment to pepo, flesh often nearly solid: usually a long runner, but in some races plant condensed and tendrils abortive as in Zucchini: seeds about $\frac{1}{2}$ in. or a little more long.

2. *C. moschata*, Duchesne. CUSHAW and WINTER CROOKNECK SQUASHES. Plant long-running, soft to the hand: lvs. limy and velvety, not stoutly upright, usually broad-ovate to nearly circular-ovate in outline and not lobed, but sometimes lobed and much like *C. Pepo* in shape, often with whitish marks and blotches: corolla with wide-spreading crinkly lobes, the tube broad at base and usually not bulging above; calyx-lobes often long and frequently expanded and lf.-like at the end: peduncle angled, widely expanded at fr.: seeds thin, $\frac{3}{4}$ in. or less long, margin usually hyaline when fresh.—The frs. are known both as pumpkins and squashes; they are autumn and winter products, including the Sweet Potato, Quaker Pie and Japanese Pie pumpkins. Var. *melanæformis*, Bailey, lvs. more rounded; peduncle long, angled, expanded at apex; fr. furrowed.

3. *C. maxima*, Duchesne. AUTUMN and WINTER SQUASHES. Plant long-running, tendrils many, rather soft to the hand: lvs. not rigid, moderately upright, orbicular or nearly so, not lobed, base cordate with very deep sinus, margins shallow-serrate with soft points: corolla with broad usually reflexed lobes, the tube with parallel sides or bulging toward the base; calyx-lobes short and narrow: peduncle short and cylindrical or enlarged at middle, often somewhat spongy, not expanded at attachment: fr. often glaucous or bluish; seeds plump, $\frac{1}{2}$ - about 1 in. long, margin obtuse.—The Hubbard and Boston Marrow are of this species; also the Mammoth Chile and other immense frs.

Var. *turbaniformis*, Alef. (*C. turbaniformis*, Roem.). TURBAN SQUASHES. Fr. turban-shaped, the central part or ovary enlarged and protruding and holding remains of the corolla, the outer pericarp wall also developing fully so that it results in "a squash within a squash": vines long and vigorous, tendriliferous.

4. *C. ficifolia*, Bouché (*C. melanosperma*, Gaspar.). FIGLEAF and MALABAR GOURD. Extensively running, the sts. setose and harsh to the hand: lvs. circular-ovate to nearly reniform, 7-10 in. across, sinuate to lobed and with obtuse sinuses, the basal sinus broad

and margined by the lateral ribs, margins apiculate-serrate to practically entire; corolla with spreading large lobes, the tube broad and expanding upward; calyx-lobes very narrow and short; peduncle angled, expanded at attachment: fr. oblong or nearly globular, 6-12 in. long, green with white stripes, flesh white, rind hard and gourd-like; seeds black or nearly so, about $\frac{5}{8}$ in. long, with a raised margin.—Grown for its abundant foliage and ornamental frs.

5. *C. argyrosperma*, Hort. SILVERSEED GOURD. Vigorous grower and runner, main sts. glabrous: lvs. broad-ovate to nearly reniform, about 9 in. across either way at maturity, outline nearly regular or indifferently wavy or sublobed, margins serrate, petiole sparsely apiculate: fls. deep yellow and usually green-striped, limb and tube broad and flaring: fr. short-oblong to somewhat pyriform, 7-9 in. long and thick, striped green and white, peduncle angled and expanded at attachment; seeds large and flat, more than 1 in. long and to $\frac{3}{4}$ in. broad, center white, border banded broadly with bluish.

2. *SICANA*, Naud. Glabrous monœcious long-running vine sometimes cult. in U. S. and frequent in tropics; 1 or 2 other species from trop. Amer.—Differs from *Cucurbita* in anthers being free although connivent; lobes of calyx and corolla short and reflexed. (*Sica-na*: name in Peru.)

S. odorifera, Naud. CURUBA. CASSABANANA. Per., sts. angled, tendrils branched: lvs. large, nearly orbicular to reniform in outline, 5-12 in. across, strongly lobed, cordate at base, margins angled or repand-toothed: fls. solitary, yellowish, staminate about $\frac{3}{4}$ in. long, pistillate about 2 in. long with the slender ovary; stigmas 3, each 2-lobed: fr. long-oblong, 1-2 ft., nearly cylindrical, black-purple to orange-crimson, sometimes with strong aroma; seeds small and thin, about $\frac{1}{2}$ in. long, with prominent brown border, otherwise white or tawny. Probably Brazil, but spread elsewhere.—Grown mostly for its ornamental fragrant fr., which is also sometimes eaten.

3. *LUFFA*, L. Annuals, or grown as such; species few, in Old World tropics.—Monœcious, nearly or quite glabrous: tendrils branched: lvs. 5-7-lobed: fls. yellow or whitish, showy; staminate racemose, pistillate solitary and short- or long-peduncled; corolla of 5 deep lobes; anthers free; ovary with 3 placenta, the stigmas 3 and 2-lobed, ovules many: fr. long and cylindrical or short and clavate, the rind becoming dry and papery, not hairy, the interior fibrous; seeds small, black. (*Luf-fa*: from *luff*, the Arabic name).—The dried fibrous interior of the frs. is used as a sponge, whence the names Vegetable-Sponge, Dishcloth gourd, Rag gourd; young fr. sometimes eaten.

A. Ovary not ribbed and cornered, usually cylindrical and tomentose: lvs. mostly deeply lobed.....1. *L. cylindrica*
 AA. Ovary ribbed and angled, mostly rather short and club-shaped and not tomentose: lvs. not deeply lobed.....2. *L. acutangula*

1. *L. cylindrica*, Roem. Strong vine, sts. slender and angled: lvs. deltoid to nearly circular in outline but pointed, 5-12 in. long, mostly 3-7-lobed, with close or open base, margins dentate, scabrous but not pubescent: fls. 2-4 in. across, light yellow: fr. nearly or quite cylindrical, 1-2 ft. or more long, straight or curved, usually with light furrows and stripes but not ribbed or angled; seeds flat, about $\frac{1}{2}$ in. long, black or nearly so, smooth, margined.—The common species in cult. in N. Amer., and escaped in American tropics.

2. *L. acutangula*, Roxb. Lvs. usually not so large, very scabrous, angled but not deeply lobed: fr. clavate, 6-12 in. long, strongly ridged; seeds thicker than in *L. cylindrica*, flattish, about $\frac{1}{2}$ in. long, black, reticulate or sculptured, not margined.

4. *BENINCASA*, Savi. Two ann. vines of trop. Asia, one sometimes grown for the fr. which is eaten, mostly as conserves and pickles.—Monœcious: tendrils branched: fls. solitary, yellow, large and showy, the staminate long-peduncled and pistillate short-stalked or nearly sessile; corolla rotate, 5-parted to base; anthers free; ovary with 3 placenta, stigmas 3, ovules many: fr. fleshy and without durable rind. (*Beninca-sa*: name of an Italian nobleman, patron of botany.)

B. hispida, Cogn. (*B. cerifera*, Savi). WHITE GOURD. CHINESE PRESERVING MELON. Long-running, with brown-hairy sts.: lvs. broad-ovate to reniform-ovate, 6-10 in. across, angled but not lobed, cordate at base with sinus bordered at top by the lateral ribs, margins dentate, hairy or becoming nearly glabrous: fls. 3-4 in. across: fr. nearly spherical to long-oblong, often 10-16 in. long, hairy and white-waxy, becoming glabrous; seeds about $\frac{1}{2}$ in. long, smooth, white.—Sometimes sold as Cassabanana.

5. **LAGENARIA**, Ser. BOTTLE GOURD. One variable long-running ann., probably native in Old World tropics but now widespread in warm countries and cult. for ornament and for the astonishing variety of thin-shelled frs. that are used for receptacles, utensils, bird-houses and decoration.—Monœcious, or only rarely diœcious: tendrils branched: fls. solitary, white, showy, perishing toward midday, 5-petalled; staminate on very long peduncles, often surpassing the foliage; anthers lightly cohering, but not connate; ovary long or short, with 3 placenta, ovules numerous and horizontal: fr. of many sizes and shapes, with hard durable shell; seeds oblong to nearly square, $\frac{3}{4}$ in. or less long, ridged on margins and cornered, tan to brown. (Lagenaria: Latin *lāgena*, a bottle, from the fr.)

L. siceraria, Standl. (*Cucurbita siceraria*, Molina. *C. leucantha*, Duchesne. *L. vulgaris*, Ser. *L. leucantha*, Rusby). WHITE-FLOWERED GOURD. Musky-scented soft viscid-pubescent vine with branched tendrils: lvs. cordate-ovate to reniform-ovate, 6–12 in. across, not lobed or sometimes only indifferently so, broad-cordate at base, margins apiculate-dentate: fls. 2–4 in. across: fr. 3 in. to 3 ft. and more long, from disk-like to nearly globular and bottle-shaped, dumbbell-shaped, club-shaped, crooknecked and coiled, sometimes striped or mottled but prevailing greenish or tan, in some cases knobby or ridged. (Siceraria: from *sicera*, a drinking vessel.)—Here are included the Dipper, Sugar-trough, Hercules Club and other gourds; also the Calabash gourd, although the name calabash belongs with *Crescentia*.

6. **CITRULLUS**, Neck. Four recognized species, all in trop. Afr. and 1 probably native also in Asia; one species widely grown for its edible fr.—Monœcious annuals or perennials, long-running, more or less hairy, with branched tendrils: lvs. deeply pinnatifid, the lobes again lobed: fls. of medium size, light yellow, solitary in the axils; corolla 5-parted nearly to base; anthers free; ovary with 3 placenta and many ovules, the stigmas 3. (Citrullus: diminutive of *citrus*, in some allusion to the frs.)

C. vulgaris, Schrad. WATERMELON. Hairy ann.: lvs. ovate to ovate-oblong in outline, 4–7 in. long, cordate at base, pinnately divided into 3 or 4 pairs of lobes and these again lobed and toothed, the segms. broad at the apex: peduncles much shorter than the lvs.: corolla about $1\frac{1}{2}$ in. across, rotate, the 5 lobes obovate and obtuse: fr. globular or oblong, sometimes 2 ft. or more long, mostly glabrous, with a hard but not durable rind, striped green, and sweet red, green or yellow flesh; seeds white, black or reddish, flat, smooth, $\frac{1}{4}$ – $\frac{1}{2}$ in. long. Trop. and S. Afr., spontaneous in warm countries. Var. *citroides*, Bailey, CITRON, PRESERVING MELON, fr. hard, white-fleshed, not edible from the hand, surface often mottled, lf.-lobes broad and obtuse, seeds greenish or tan.

7. **CUCUMIS**, L. Some 30 species of annuals and perennials, trailing or climbing, in warm countries, mostly African, a few grown for the edible and interesting frs.—Monœcious or rarely diœcious, mostly hairy: tendrils simple: lvs. entire or dissected: fls. yellow, not large, solitary but the staminate sometimes more than 1 in an axil, usually short-stalked and underneath the foliage; corolla open-bell-shaped to rotate, deeply 5-parted; anthers free; ovary with 3–5 placenta and stigmas, many-ovuled, the style short: fr. fleshy and usually indehiscent, globular to elongated, glabrous, pubescent or echinate. (Cucumis: Latin name of a plant with cucumber-like odor.)

- A. Fr. spiny, muricate or echinate.
- B. Lvs. deeply lobed, with rounded sinuses.....1. *C. Anguria*
- BB. Lvs. not lobed or only shallowly so and with acute or very narrow sinuses or angulate.
- c. Mature fr. bur-like, beset with hairs, not edible.....2. *C. dipsaceus*
- cc. Mature fr. prickly or muricate, edible.....3. *C. sativus*
- AA. Fr. glabrous or only pubescent (sometimes somewhat warty).....4. *C. Melo*

1. **C. Anguria**, L. (*C. grossulariaeformis*, Hort.). WEST INDIA or BUR GHERKIN. Slender rough-hairy trailing vine with angled sts. and small tendrils: lvs. $1\frac{1}{2}$ – $3\frac{1}{2}$ in. long, with 3 prominent main lobes divided by sinuses with enlarged rounded bottoms, the lateral lobes usually again lobed, lobes broad and obtuse, margins apiculate, sinuate-serrate, very scabrous: fls. $\frac{1}{8}$ – $\frac{1}{2}$ in. across, or the staminate sometimes broader, on slender peduncles: fr. oval or oblong, about 2 in. long, on crooked peduncles, furrowed, prickly, with very many small white smooth seeds less than $\frac{1}{4}$ in. long. (Anguria: a Greek name for some cucurbitous fr.) Fla. and Tex. to S. Amer.—Grown for curiosity and for use in pickles; the “gherkins” of mixed pickles, however, are usually young cucumbers.

2. *C. dipsaceus*, Ehrh. HEDGEHOG or TEASEL GOURD. Slender trailer with strongly setose angled sts.: lvs. much like those of *C. Melo*, broad-ovate to nearly reniform-ovate, 3-4½ in. across, not lobed, cordate at base, sinuate-serrate, setose and scabrous: fls. small, the staminate ½-¾ in. across, on long peduncles: fr. a hard dry bristly oblong bur 1-2 in. long; seeds flat, white, little more than ½ in. long. Arabia.—Grown for ornament and curiosity.

3. *C. sativus*, L. CUCUMBER. Trailing or climbing, rough-hairy, with strong angled sts.: lvs. triangular-ovate, 3-6 in. long, angled or somewhat 3-lobed and with acute or not rounded sinuses, the middle lobe pointed, very scabrous: fls. 1-1½ in. across, very short-pedicelled, the staminate often several in one axil, the corolla-lobes acute: fr. from nearly globular to oblong and elongated, prickly with sharp elevations; seeds flat, white, a little more than ¼ in. long. S. Asia. Var. *anglicus*, Bailey, ENGLISH FORCING CUCUMBER, a group of cultivars with very strong and vigorous sts.: lvs. large and broad, rather short in proportion to breadth, sometimes 1 ft. long; fls. very large; fr. slender, sometimes 3 ft. long, little furrowed and nearly or quite spineless, producing few seeds.

4. *C. Melo*, L. MELON. MUSKMELON. Trailing or somewhat climbing soft-hairy vine with striate or angled sts.: lvs. orbicular-ovate to nearly reniform, 3-5 in. across, angled but usually not distinctly lobed, rounded at apex, margins sinuate-dentate, hairy and somewhat scabrous: fls. about 1 in. across, the staminate sometimes more than 1 in an axil, the corolla-lobes essentially obtuse: fr. various, in the usual forms globular or oblong, more or less furrowed, not spiny or echinate, pubescent but usually becoming glabrous, with a pronounced musky odor, usually with yellow or green flesh; seeds white, slender, nearly ½ in. long. (Melo: old Latin name for a form of melon.) Probably Cent. Asia.—It has given rise to many races and cultivars. Var. *reticulatus*, Naud., NETTED or NUTMEG MELONS, fr. small with the surface net-ribbed. Var. *cantalupensis*, Naud., CANTALOUPE MELONS (from Cantaluppi, near Rome, where these melons were early grown from S. W. Asian stock), fr. with hard rinds, often furrowed, scaly, warty or rough; in N. Amer. the name cantaloupe is commonly improperly applied to muskmelons in general.

Var. *inodorus*, Naud. WINTER or CASSABA MELON (the latter a geographical name in S. W. Asia). Strong and long-tendrilled vines: lvs. large, often 8 in. and more long, sparsely hairy, sometimes deeply lobed: fls. often 2 in. across: fr. large, maturing late and keeping in winter, squash-like in shape and often striped and splashed, usually white-fleshed, with little musky odor and flavor.

Var. *flexuosus*, Naud. (*C. flexuosus*, L.). SNAKE or SERPENT MELON. Plant like *C. Melo* itself: fls. often larger, the ovary very long: fr. 18-40 in. long and 1-3 in. thick, furrowed, often crooknecked or coiled, slightly pubescent, the flesh white and cucumber-like, slightly acid.—Fr. sometimes used in preserving, but raised mostly as a curiosity.

Var. *Conomon*, Makino (*C. Conomon*, Thunb.). ORIENTAL PICKLING MELON. Vine the stature of *C. Melo*, with setose-prickly sts.: lvs. on the ovate-oblong order, shallowly side-lobed and the middle lobe large and rounded, petioles setose: fls. large: fr. various in shape, smooth and glabrous, with longitudinal lines and perhaps somewhat furrowed, pale green, flesh white or green, not musky and not sweet, sometimes oblong-cylindrical and slightly clavate, to 24 in. long and 6 in. thick, in other forms much shorter, again turban-shaped or constricted midway. (Conomon: from the Japanese *konomono*, a food used with rice but principally prepared from the radish.)

Var. *Chito*, Naud. (*C. Chito*, Morr.). MANGO MELON. Stature of *C. Melo*, with setose-hairy sts.: lvs. as in *C. Melo*, except mostly smaller: fr. size and shape of orange or lemon, or sometimes oblong, yellow or greenish-yellow, not variegated nor fragrant, the flesh white and cucumber-like. (Chito is probably a geographical name.)—Frs. used in the making of preserves and pickles, under the names Mango, Orange Melon, Vegetable-Orange, Lemon-Cucumber, Melon-Apple, Vine-Peach.

Var. *Dudaim*, Naud. (*C. Dudaim*, L. *C. odoratissimus*, Moench). DUDAIM MELON. Small plant with hairy-setose slender angled sts.: lvs. ovate-oblong and unlobed, usually about 2 in. long but becoming 6 in. long: fls. relatively large: fr. size of a medium orange, somewhat oblate, longitudinally marbled with rich brown, very fragrant. (Dudaim: a Hebrew name, said to be scriptural.)—Grown for the ornamental perfumed fr.

8. *SECHIUM*, P. Br. (*Chayota*, Jacq.). One slender glabrous or sparsely hairy per. vine of trop. Amer., cult. for its edible fr. and tubers.—Monœcious: tendrils large, branched: fls. small, the staminate in small peduncled clusters, pistillate shorter-stalked in the same axils; corolla cup-shaped to nearly rotate, deeply 5-lobed; anthers free, but the filaments, as well as the styles, connate: fr. fleshy, with 1 large seed. (Se-chium: name obscure.)

S. edule, Sw. CHAYOTE. CHRISTOPHINE. Roots tuberous: sts. ann., trailing and climbing: lvs. broad-ovate to triangular-ovate, 4-8 in. long, angled but scarcely or shallowly lobed, the points apiculate, margins entire: fr. mostly pyriform, 3-8 in. long, furrowed and

wrinkled, green or whitish, at the end nearly closing over the single large flat seed which is 1-2 in. long.—Fr. and root-tubers much prized in trop. and sub trop. regions as vegetables.

9. **COCCINIA**, Wight & Arn. (*Cephalandra*, Schrad.). Per. trop. vines of Asia and Afr., usually with tuberous roots, one more or less grown for ornament and as an arbor vine.—Mostly dioecious: tendrils branched in ours: lvs. angled or lobed, sometimes glandular: fls. large, white or yellowish, solitary or clustered; corolla bell-shaped, lobed to middle; stamens connate; ovary with many ovules; fr. small, berry-like, oblong or cylindrical, often highly colored. (*Coccinia*: Latin *scarlet*.)

C. cordifolia, Cogn. (*C. indica*, Wight & Arn.). IVY GOURD. Sts. slender, long-running and -climbing, furrowed, glabrous; tendrils simple: lvs. triangular-ovate, 2-3 in. across, angle-lobed but not deeply so, cordate at base, sinuate-serrulate or entire on margins: fls. white, slender-peduncled, about $1\frac{1}{2}$ in. long, with acute flaring corolla-lobes: fr. 1-2 in. long, scarlet; seeds white, about $\frac{1}{4}$ in. long. S. E. Asia.

10. **TRICHOSANTHES**, L. Ann. and per. herbs, perhaps woody at base, sometimes with tuberous roots, in the tropics of Asia, Polynesia and Australia, one frequently grown for ornament and food.—Monœcious or dioecious: tendrils mostly branched: lvs. entire or lobed: fls. white, the staminate racemose; corolla rotate or cup-shaped, the petals or lobes 5 and lacinate; stamens 3; ovary 1-celled, with many ovules: fr. fleshy, short or elongated. (*Trichosanthes*: Greek *hair-flower*, from the fimbriate corolla.)

T. Anguina, L. (*T. colubrina*, Jacq.). SERPENT or SNAKE GOURD. Long-running or -climbing ann., with slender angled short hairy sts.; tendrils branched: lvs. broad-ovate to triangular-ovate, 4-9 in. long, shallowly 3-lobed or unlobed, deeply and broadly cordate at base, margins sinuately apiculate-dentate, nearly or quite glabrous: fls. long-peduncled and showy, 2 in. or more across: fr. 1-6 ft. long, very slender, long-tapering to the point, variously curved or coiled, glabrous, greenish-white; seeds about $\frac{1}{2}$ in. long, thick, scalloped on the edges, brownish. (*Anguina*: Latin *anguis*, serpent.) India.—Grown for the curious fr., which is also sometimes eaten. The name "snake gourd" is sometimes applied to forms of *Lagenaria*.

11. **MOMORDICA**, L. Ann. and per. climbing herbs of 35-40 species in trop. Afr. and Asia, 2 commonly cult. for ornament and somewhat for food.—Monœcious or dioecious: tendrils simple or forked: lvs. simple or compound: pistillate fls. solitary, yellow or sometimes white, the staminate solitary or panicle (solitary in ours), peduncle in ours bearing a prominent broad bract; corolla rotate or open-bell-shaped, mostly parted nearly to the base; anthers free; ovary with 3 placenta, the stigmas 3 and sometimes 2-lobed: fr. oblong or nearly spherical, small or large, often spiny-tuberculate, usually indehiscent but sometimes splitting at maturity into 3 valves. (*Momordica*: Latin *mordeo*, to bite, the seeds sometimes jagged as if bitten.)—Ours are porch vines and run wild in warm countries.

A. Bract serrate, on the sterile peduncle placed on the upper part. 1. *M. Balsamina*
AA. Bract entire, at the middle or base of peduncle 2. *M. Charantia*

1. **M. Balsamina**, L. BALSAM-APPLE. Very slender but high-climbing glabrous monoecious ann. with simple tendrils: lvs. thin and glabrous, cordate-orbicular to broadly triangular-ovate in outline, 2-4 in. across, 3-5-lobed with broad or rounded sinuses and pointed-toothed: fls. yellowish and usually with darker center, the staminate $1-1\frac{1}{4}$ in. across and on slender peduncles, the pistillate smaller and usually on shorter stalks; bract shield-like, serrate, well toward the top of the staminate peduncle: fr. ovoid or ellipsoid, $1\frac{1}{2}$ -3 in. long, narrowed to both ends, with points or prominences (sometimes nearly smooth), orange; seeds elliptic, about $\frac{1}{2}$ in. long, thick but flat, gray or brown, somewhat scalloped on edges and pattern-veined. (*Balsamina*: herbalist name adopted by Linnæus.) Old World tropics.

2. **M. Charantia**, L. BALSAM-PEAR. Mostly a longer vine than no. 1, ann., with larger more deeply lobed lvs., the margins sinuate and with apiculate points: bracts entire, at the base or not above the middle of the peduncle: fr. oblong or oval and narrowed both ways, 4-8 in. long, orange-yellow, covered with blunt warts, bursting at maturity and showing the scarlet arils; seeds about $\frac{1}{2}$ in. long, cornered at the ends, thick but flat, light gray or brown, with prominent patterns. (*Charantia*: herbalist name, used by Dodonæus.) Old World tropics.—An ingredient of curries with some peoples, and used medicinally.

12. **ABOBRA**, Naud. A single species in extra-trop. S. Amer., sometimes grown under glass for its ornamental frs. and finely cut foliage.—Dioecious, with small green axillary solitary fragrant fls. and mostly forked tendrils: corolla rotate, 5-parted, woolly within; anthers free; ovary 3-4-celled, with 2 erect ovules in each cell: fr. ovoid and berry-like. (Abo-bra: Brazilian name.)

A. tenuifolia, Cogn. (*A. viridiflora*, Naud.). Per. with fleshy root and herbaceous sts., 10-30 ft.: lvs. broad-ovate in outline, 2-5 in. long and about as broad, cut into linear divisions, more or less white-punctate: fr. smooth, about $\frac{1}{3}$ - $\frac{1}{2}$ in. long, becoming carmine, glabrous.

13. **CYCLANTHERA**, Schrad. Thirty and more species in warm and trop. Amer., ann. and per.; one sometimes grown as an arbor or veranda vine.—Monoecious ann. and per. herbs with simple or branched tendrils, mostly glabrous: lvs. usually lobed or palmate: fls. small, white or greenish, the pistillate solitary and staminate racemose or paniculate; corolla rotate, 5-parted; ovary commonly 3-celled, with 2 or more ovules in each cell; style short, stigma large and circular: fr. ovoid and oblique, usually spiny, beaked, elastically dehiscent. (*Cyclanthe-ra*: Greek *circle anther*.)

C. pedata, Schrad. Ann. strong-smelling vigorous glabrous vine with branched tendrils: lvs. pedately parted to the base, with 5-7 lance-oblong dentate parts or lfts. and the lateral ones again lobed or parted: fls. small and inconspicuous: fr. elliptic-oblong, about 2 in. long, soft-prickly, yellowish-white, short-stalked; seeds $\frac{1}{4}$ - $\frac{1}{2}$ in. long, flat, cornered, blackish. Mex., Cent. Amer.—Quickly covers fences and screens.

14. **ECHINOCYSTIS**, Torr. & Gray (*Micrampelis*, Raf.). About 25 ann. and per. species in N. and S. Amer., one offered by seedsmen as a screen and veranda vine.—Monoecious, with branched tendrils and lobed or angled lvs.: fls. white or whitish, mostly small but often profuse, the staminate racemose or paniculate and the pistillate usually solitary; corolla rotate, deeply 6-parted or of 6 petals; filaments connate, anthers variously coherent; ovary mostly 2-celled or 1-celled with 2 placentæ, ovules erect and 2 in each cell: fr. fleshy or dry, sometimes bladdery, not large, opening at the top. (*Echinocys-tis*: Greek *hedgehog* and *bladder*.)

E. lobata, Torr. & Gray. WILD-CUCUMBER. Ann.; sts. slender, angled, glabrous or hairy at nodes, reaching 20 ft. or more: lvs. cordate-ovate, 3-5 in. long, 3-7-lobed less than to middle, lobes apiculate, margins entire or sparsely serrate: staminate fls. numerous in long compound axillary racemes: fr. short-oblong, $1\frac{1}{2}$ -2 in. long, puffy, with slender weak spines; seeds $\frac{1}{2}$ - $\frac{3}{8}$ in. long, brownish, nearly plain. Thickets N. B. to Man. and Tex.

15. **BRYONIA**, L. BRYONY. Per. herbs, 10-12 species, mostly in Eu., one sometimes sold by seedsmen as a cover vine.—Mostly dioecious, with simple or forked tendrils, and angled or lobed lvs.: fls. rather small, the staminate in peduncled racemes or cymes, the pistillate solitary or in short axillary clusters; corolla rotate or open-bell-shaped, 5-parted; anthers free; ovary with 3 placentæ, the 3-parted style slender, stigmas simple or 2-lobed; ovules horizontal: fr. a spherical berry. (*Bryo-nia*: Greek *to sprout*, referring to the shoots that come annually from the tuber.)

B. dioica, L. Strong-climbing from tuberous roots, with simple tendrils: lvs. scabrous, cordate-ovate or broader, 3-5 in. across, 3-5-lobed, lobes sharp-pointed or apiculate, margins sinuate or obscurely toothed: corolla greenish, $\frac{3}{4}$ in. or less across: fr. $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., red, with few small plump brownish seeds. Eu. and W. Asia.

16. **MELOTHRIA**, L. If defined broadly, probably 70 species, native in the warmer parts of both hemispheres; annuals and perennials; seed of one is offered as an ornamental vine.—Monoecious, at least in ours which also has simple tendrils: lvs. entire or lobed: fls. small, the staminate racemose or corymbose, pistillate solitary or clustered; corolla rotate or short-bell-shaped, deeply 5-parted; filaments free, anthers free or barely coherent; ovary contracted beneath the corolla, with 3 placentæ, and many horizontal ovules; style short, stigmas mostly 3: fr. small and berry-like, glabrous or warty. (*Melo-thria*: old name, not satisfactorily explained.)

M. scabra, Naud. Slender climber, with lightly hairy angled or grooved sts.: lvs. triangular-ovate, 2-4 in. long, shallowly 3-5-lobed, rather deeply cordate, margins re-

motely apiculate, scabrous above, light-hairy on veins beneath: fls. very small, slender-peduncled, the staminate 3-7: fr. ovoid to short-oblong, $\frac{3}{4}$ -1 in. long, glabrous, more or less green-spotted; seeds dull white, very small and smooth. Mex.

17. **ECBALLIUM**, A. Rich. SQUIRTING-CUCUMBER. One trailing per. in the Medit. region, without tendrils, grown for its odd frs.—Monœcious: fls. yellow, pedunculate, pistillate solitary and often in the same axil with the staminate raceme; corolla rotate or open-bell-shaped, deeply 5-parted with acute lobes; anthers free; ovary long, with 3 placenta and many ovules, the style very short and bearing 3 bifurcate stigmas. (Ecbal-lum: Greek *to eject*, from the fr.)

E. **Elaterium**, A. Rich. (*Momordica Elaterium*, L.). Hairy-pubescent: lvs. triangular-ovate, 3-4 in. long, broadly cordate, angled or somewhat obscurely lobed, margins sinuate, gray-tomentose beneath: fls. 1 in. across: fr. oblong, $1\frac{1}{2}$ -2 in. long, rough-hairy, greenish, at maturity detaching from the peduncle and squirting the brownish seeds from the point of attachment. (Elaterium: old substantive, associated with Greek *to drive*.)

Fig. 192. CAMPANULACEÆ. A, *Jasione perennis*: inflorescence, $\times 1$. B, *Adenophora polymorpha*: Ba, flower, vertical section, $\times \frac{1}{2}$; Bb, detail of gland above ovary, $\times 2$. C, *Campanula latifolia*: Ca, flowering branch, $\times \frac{1}{2}$; Cb, flower, vertical section, $\times 1$; Cc, ovary, cross-section, $\times 3$; Cd, capsule, \times about 1; Ce, detail of gland above ovary. D, *Michauxia campanuloides*: flower, $\times \frac{1}{2}$. E, *Platycodon grandiflorum*: Ea, flower and bud, $\times \frac{1}{2}$; Eb, capsule, $\times \frac{1}{2}$. (g gland.)

192. CAMPANULACEÆ. BELLFLOWER FAMILY

Herbs as usually known to cultivators, but sometimes shrubs and even trees, about 1,000 species in some 40 genera, of wide distribution in trop. and temp. regions; the family yields many choice ornamentals.—Cult. species erect but others climbing, mostly with milky juice: lvs. usually alternate, exstipulate, simple and only rarely much lobed or divided: fls. bisexual and regular or nearly so, solitary, spicate, racemose or paniculate, prevailing blue but sometimes white, the gamopetalous corolla 5-lobed or -divided; calyx-tube adnate to ovary, the limb 5-lobed, usually persistent on the fr.; stamens 5, inserted on calyx-rim or slightly on corolla base, the filaments separate or united, sometimes dilated at base; ovary inferior in the genera here included, mostly 2-5-celled and with axile placenta, or 1-celled with 2 parietal placenta, the ovules many; style 1, stigmas sometimes several: fr. in ours a dehiscent caps.—The bellflowers add an interesting note to gardens because so many of them provide fls. in the blue series, although prevailing the greater number of these colors are lilac or shades of purple.

A. Lvs. alternate on st., or in some cases clustered at base of plant.

B. Fls. separate from each other rather than aggregate in dense involucre or bracted terminal heads.

C. Corolla open-bell-shaped.

D. Caps. or seed-pod opening at maturity on its sides or base by slits or pores, its apex closed.

E. Ovary hemispheric or top-shaped or conical.

F. Anthers distinct or separate from each other.

G. Style not surrounded by a cup-like disk. 1. CAMPANULA

- GG. Style surrounded by or immersed in a deep cup-like disk or gland. 2. ADENOPHORA
 FF. Anthers connate into a tube. 3. SYMPHYANDRA
 EE. Ovary linear or narrowly oblong. 4. SPECULARIA
 DD. Caps. opening at apex, by valves between the calyx-lobes.
 E. Plant weak, vine-like or decumbent, mostly soon lying on the ground. 5. CODONOPSIS
 EE. Plant erect or arching, even if sometimes small and low.
 F. Stature of plant tall; leafy, bearing very large open-bell-shaped
 fls. blue to white, mostly solitary. 6. PLATYCODON
 FF. Stature low, often tufted and lvs. clustered at base; fls. small.
 G. Apex of caps. opening regularly by compartments. 7. WAHLENBERGIA
 GG. Apex of caps. opening irregularly. 8. EDRAINTHUS
 CC. Corolla divided nearly to base, lobes reflexed. 9. MICHAUXIA
 BB. Fls. in compact terminal involucre or bracted heads or short spikes or close
 corymbiform clusters, mostly not bell-shaped.
 C. Form of corolla bell-shaped, even if narrowly so. 8. EDRAINTHUS
 CC. Form of corolla not bell-shaped, very narrow, often closed at apex.
 D. Caps. closed at apex.
 E. Corolla narrow-tubular, 5-fid, not prolonged at apex. 10. TRACHELIUM
 EE. Corolla long-tubular at apex, not parted, curved, split at base. 11. PHYTEUMA
 DD. Caps. opening at apex: corolla narrow, 5-fid to base. 12. JASIONE
 AA. Lvs. long, whorled on st.: large plant with white or tinted fls.: caps. opening by
 many long valves on side. 13. OSTROWSKIA

1. **CAMPANULA**, L. **BELFLOWER**. Sometimes ann. and bien., but mostly per. herbs, of some 250 species largely in the northern hemisphere, chiefly in Eu.; many are choice garden plants.—Often tufted: root-lvs. frequently unlike the st.-lvs., the latter sometimes few: genus specially known by the pod ovoid or turbinate and dehiscent below the persistent calyx-rim by pores or separate valves, the clavate style not surrounded by a fleshy disk, corolla bell-shaped to rotate and 5-toothed or -lobed and not split at base or otherwise, fls. solitary, spicate, racemose, paniculate, not in compact composite-like heads; stamens usually dilated at base; stigmas 3 in ours except *C. Medium*, and caps. 3-celled: caps. opening near the base in some species, near the top in others. (*Campan-ula*: Latin *little bell*.)—Species greatly confused in cult. and many of the garden names are unreliable. Such persistent and variable species as *C. rapunculoides*, *C. rotundifolia*, *C. carpatica*, *C. persicifolia* are likely to be grown under different names, and so explained in the following text. Canterbury bells, *C. Medium*, is an old easily grown garden favorite.

- A. Species fl.-garden annuals, grown from seeds each year.
 B. Plant erect to 2 ft.: style large and long-protruded. 1. *C. macrostyla*
 BB. Plant small, diffuse and weak, more or less decumbent: style not prolonged.
 C. Corolla bell-shaped. 2. *C. drabifolia*
 CC. Corolla wide open, nearly or quite rotate. 3. *C. ramosissima*
 AA. Species per. (bien. in no. 21), being border and plantation subjects.
 B. Plant very low, tufted: small rock-garden and alpine subjects. (Dwarf hort. forms of *C. carpatica*, no. 28, with cordate-ovate dentate lvs., not to be sought here.)
 C. Lvs. on st. and usually also at base long and narrow, often sharp-pointed, sometimes nearly grass-like, not bearing a distinct petiole.
 D. Fls. in nature single or solitary on each leafy st. or shoot (sometimes more than 1 on developed hort. subjects).
 E. Corolla large and tubular. 4. *C. Allionii*
 EE. Corolla small and bell-shaped. 5. *C. excisa*
 DD. Fls. in nature prevailing few or several on each leafy st., although an occasional shoot or plant may be 1-fld.
 E. Narrow lvs. condensed at base of plant, few if any on st. 6. *C. cæspitosa*
 EE. Narrow lvs. scattered on st. 7. *C. Scheuchzeri*
 CC. Lvs. on st. and at base of plant expanded or broad, often dentate or notched.
 D. Fls. single or solitary on each leafy st.
 E. Calyx-lobes with prominent auricles at base. 8. *C. Saxifraga*
 EE. Calyx-lobes lacking auricles at base.
 F. Lobes of calyx sharply notched, very long and spreading. 9. *C. lasiocarpa*
 FF. Lobes of calyx not notched.
 G. Blossom closely subtended by foliage. 10. *C. Rainieri*
 GG. Blossom long-pedicelled. 11. *C. pulla*
 DD. Fls. prevailing more than 1 on each leafy st., only exceptionally with a single blossom.
 E. Sts. simple (not branched), from base of plant.
 F. Calyx-lobes very slender, $\frac{3}{4}$ in. or less long, about equalling corolla. 12. *C. Piperi*
 FF. Calyx-lobes much shorter than corolla.
 G. These lobes with linear short point: st.-lvs. very narrow and finely dentate. 13. *C. cochlearifolia*
 GG. These lobes flat and not much narrowed to end: st.-lvs. broadened and closely obtusely serrate. 14. *C. collina*

- EE. Sts. usually prominently branched; plant weak and diffuse, often droopy or vine-like; sometimes grown in pots.
- F. Corolla very large and open, mostly 1 in. or more across at full expansion.
- G. Main cauline lvs. rounded in apical outline; corolla-lobes obtuse or only very broadly tapered to apex.
- H. These lvs. mostly less than 1 in. broad, reniform: calyx-lobes short, usually less than corolla-tube. 15. *C. fragilis*
- HH. These lvs. mostly more than 1 in. broad, reniform-ovate: calyx-lobes equalling or exceeding corolla-tube. 16. *C. isophylla*
- GG. Main cauline lvs. triangularly narrowed to evident point or apex: corolla-lobes long-narrowed and conspicuously acute. 17. *C. Poscharskyana*
- FF. Corolla small, $\frac{3}{4}$ in. or less across, or else tubular and not open.
- G. Main cauline lvs. ovate or broader, toothed. 18. *C. Elatines*
- GG. Main cauline lvs. lanceolate, nearly or quite entire.
- H. Shape of corolla tubular, very shortly lobed; lower lvs. acute. 19. *C. Tommasiniana*
- HH. Shape of corolla nearly rotate at expansion, cut about half way down: lower lvs. broad and obtuse. 20. *C. Waldsteiniana*
- BB. Plant tall (unless in dwarf hort. forms), commonly much-branched, often coarse: not rock-garden subjects.
- C. Duration bien., blooming and podding second year from seed and plant then dying: corolla large, in many colors, tubular: old garden favorite, tall and erect. 21. *C. Medium*
- CC. Duration per.; long-enduring plants of hardy borders, tall and either erect or diffuse, mostly freely branching.
- D. Position of fls., or of most of them, erect or strongly ascending on the plant even though the plant itself may be diffuse or drooping.
- E. St.-lvs. linear or at most lance-linear.
- F. Lobes of calyx filiform.
- G. These lobes much shorter than corolla. 22. *C. abietina*
- GG. These lobes equalling or exceeding corolla. 23. *C. Rapunculus*
- FF. Lobes of calyx $\frac{1}{2}$ in. or more broad, flat. 24. *C. persicifolia*
- EE. St.-lvs. ovate or on that order (narrower in no. 26).
- F. Lobes of corolla bearded inside. 25. *C. Trachelium*
- FF. Lobes of corolla not bearded.
- G. Shape of corolla broadly or openly bell-form to almost saucer-form.
- H. Cauline lvs. sessile or essentially so. 26. *C. latiloba*
- HH. Cauline lvs. long-petioled.
- I. Fls. in elongated racemes. 27. *C. pyramidalis*
- II. Fls. terminating long peduncles. 28. *C. carpatica*
- GG. Shape of corolla narrowly bell-form to tubular.
- H. Bloom in dense globular terminal and axillary subtended heads. 29. *C. glomerata*
- HH. Bloom racemose or long-spicate.
- I. Lower lvs. cordate or subcordate: fls. large, $1\frac{1}{4}$ in. or more long, normally rich blue. 30. *C. latifolia*
- II. Lower lvs. not cordate or subcordate: fls. 1 in. long, normally white or pale blue. 31. *C. lactiflora*
- DD. Position of fls. habitually nodding, deflexed or declined.
- E. Calyx with prominent appendage at base of each sinus.
- F. St. and under surface of lvs. tomentose or soft-pubescent: fls. white. 32. *C. alliariaefolia*
- FF. St. and lvs. glabrous or only hairy or lightly pubescent or roughish: fls. violet or blue.
- G. Basal lvs. broadly cordate-ovate to reniform.
- H. Fls. sessile or practically so, in axils. 33. *C. Grossekii*
- HH. Fls. distinctly pedicelled.
- I. Corolla $1\frac{1}{2}$ –2 in. long: coarse plant. 34. *C. punctata*
- II. Corolla 1 in. or less long: small slender plant. 35. *C. Raddeana*
- GG. Basal lvs. narrow, lance-oval or much longer than broad.
- H. Style long-projected at full anthesis. 36. *C. longistyla*
- HH. Style not projected. 37. *C. sarmatica*
- EE. Calyx lacking appendages in sinuses or at base.
- F. Foliage fleshy and viscid. 38. *C. Vidalii*
- FF. Foliage not fleshy or viscid.
- G. Fl.-sts. mostly devoid of developed lvs., bearing bracts, lvs. basal. 39. *C. barbata*
- GG. Fl.-sts. leafy.
- H. St.-lvs. of the ovate pattern.
- I. Fls. secund, in a long one-sided raceme. 40. *C. rapunculoides*
- II. Fls. not secund. 41. *C. rhomboidalis*
- HH. St.-lvs. linear or grass-like: calyx-lobes linear and short. 42. *C. rotundifolia*

1. *C. macrostyla*, Boiss. & Heldr. Hispid branching ann., 1–2 ft.: lvs. ovate-oblong, 1–2 in. long, the upper ones ovate-lanceolate, all sessile and more or less clasping, margins entire or remotely denticulate: fls. solitary and erect on stout peduncles, 2–2½ in. across, the corolla broad and open, dull purple and violet-marked within, pale purple without; calyx strongly appendaged, the lobes long-pointed and nearly or quite equalling the corolla; stigmas long-protruded, about 1 in. long. Taurus Mts., Asia Minor.

2. *C. drabifolia*, Sibth. & Smith (*C. attica*, Boiss.). Ann., somewhat erect, much-branched, 3-6 in. high, hispid; lvs. hairy, elliptic-oblong and dentate toward apex, somewhat lobed, most of them less than $\frac{1}{2}$ in. long, lower ones tapering to base; fls. pedicellate; corolla open-bell-shaped, $\frac{1}{2}$ in. or less long, with a white glabrous tube and blue pilose limb; calyx-lobes narrow, erect. Greece, Asia Minor.

3. *C. ramosissima*, Sibth. & Smith (*C. Loreyi*, Poll.). Ann., erect, 6-12 in., glabrous or somewhat hairy, branched above; lower lvs. obovate to ovate-lanceolate, crenate, nearly glabrous, obtuse; upper lvs. $\frac{3}{4}$ -2 in. long, lanceolate or narrower, acute; fls. solitary on long erect peduncles, violet with lighter base (a white var.), 1 in. or more across; calyx hairy at base, the lobes narrow and long-acuminate and about equalling or even exceeding the nearly rotate or saucer-shaped corolla. S. E. Eu.

4. *C. Allionii*, Vill. Compact tufted hirsute-pubescent per. 2 or 3 in. high in nature; lvs. narrow-oblong to nearly linear, 2 in. or less long, entire; fls. usually single on each leafy st., about $1\frac{3}{4}$ in. long, hanging or declined, tubular with flaring pointed lobes, bright violet-blue varying to white; corolla much exceeding the pointed calyx-lobes; calyx with lobes in sinuses; caps. opening by 3 basal pores. (For *C. Allioni*, page 38.) Alps of Italy and S. France.

5. *C. excisa*, Schleich. Very slender per., glabrous, erect, 3-6 in. high in tufts: lvs. linear, spreading; fls. upright but becoming deflexed, bell-shaped, about $\frac{3}{4}$ in. long, blue, without reflexed lobes in sinuses; calyx-lobes short, spreading; caps. declined, opening with 3 basal pores. Alps of S. Eu.

6. *C. cæspitosa*, Scop. Low densely tufted per., erect but very slender, glabrous, 3-6 in. high; lvs. small, linear, mostly crowded near base, tapering to petiole: fls. few, spreading to nodding, about $\frac{3}{4}$ in. long, blue, said to vary to white; corolla-lobes very short; calyx-lobes very narrow and short; caps. with 3 pores at base. Mts., S. Eu.—*C. Bellardii* is a species of doubtful validity, but the plant in cult. under that name is usually *C. cæspitosa*: *C. Bellardii*-Miranda of gardens is a dwarf form of *C. carpatica*. See *C. cochlearifolia*, no. 13.

7. *C. Scheuchzeri*, Vill. Erect slender per. about 1 ft. or less, glabrous or essentially so, little if at all branched, sts. leafy: lvs. linear or the basal ones to $\frac{1}{4}$ in. broad, narrowed to long point: fls. mostly 1 but sometimes 2-4, blue, 1 in. or less long, mostly erect at first, bell-shaped; calyx-lobes filiform, almost or quite equalling the corolla; caps. with 3 basal pores. (Bears the name of Johann Jakob Scheuchzer, 1672-1733, Swiss botanist.) Mts., Cent. Eu.—Stock grown in N. Amer. under this name is likely to be *C. rotundifolia*, which is told by its taller diffuse much-branched stature, cordate radical lvs., shorter calyx-lobes.

8. *C. Saxifraga*, Bieb. Little glabrous per. 3-6 in. high, sts. simple, leafy, bearing a solitary violet-purple erect fl.: lvs. mostly broadened toward end to $\frac{1}{4}$ in. wide with long petiole-like base, margins somewhat dentate: fls. $\frac{3}{4}$ -1 in. long, bell-shaped, lobes short; calyx-lobes about one-fourth length of corolla, not pointed, with reflexed appendages: caps. with 3 basal pores, nodding. Mts., Caucasus.

9. *C. lasiocarpa*, Cham. Very low per. 1-6 in. high, glabrous, short sts. leafy, erect, simple: lvs. all notched on margins, upper ones almost linear, lower ones distinctly broadened: fls. 1 in. and more long and broad, blue, fragrant, open-bell-shaped, lobed to nearly middle; calyx-lobes prominent and spreading, about one-half length of corolla, notched: caps. opening near top, somewhat hairy. W. Canada, Wash., Alaska, Siberia, Japan.—In cult. becoming taller, somewhat branched and 3-4-fld.

10. *C. Raineri*, Perp. Tufted little lightly pubescent per. 2-4 in. high: lvs. crowded on the short st., oblong-spatulate, blunt, tapered to petiole, 1 in. long, $\frac{1}{2}$ in. broad, bluntly toothed: fls. very large, usually solitary, sessile in the foliage, broadly bell-shaped, lilac, about 1 in. long, lobes shallow and blunt; calyx-lobes long and prominent, acute, not equalling corolla, appendages none; caps. with 3 pores. (Dedicated to Archduke Rainer von Oesterreich, 1783-1864.) Alps of N. Italy, Switzerland.—The name is confused in cult., often employed for dwarf forms of *C. carpatica*; sometimes the stock is *C. Roddeana* and dwarf races of *C. rotundifolia*. The plant called *C. pseudo-Raineri* is a small *C. carpatica*.

11. *C. pulla*, L. Low glabrous per. making many slender erect sts. 2-6 in. high, bearing a solitary dark purple nodding fl. on a slender pedicel: upper lvs. nearly linear, others oblong to oval and briefly acute and narrowed to short petiole, margins obscurely indented: fls. bell-shaped, about 1 in. long, shallowly lobed; calyx-lobes short and very narrow: caps. opening by lateral pores. Alps in Austro-Hungarian region.—*C. pulloides*, a name for a garden variant, is suggestive of *C. carpatica*.

12. *C. Piperi*, Howell. Tufted glabrous per. 1-4 in. high, with leafy sts.: lvs. cuneate to spatulate, $\frac{1}{2}$ in. or more long, narrowed to petiole, sharply serrate: fls. several (seldom only 1), blue, open-bell-shaped, about $\frac{3}{4}$ in. long; calyx-lobes very narrow, about equalling corolla; caps. nearly globular. (For *C. V. Piper*, page 49.) Olympic Mts., Wash.

13. *C. cochlearifolia*, Lam. Small floriferous nearly or quite glabrous per. 2-8 in. high, not compactly tufted: st.-lvs. narrow, nearly lanceolate, becoming broader toward the ground and somewhat notched; basal lvs. broad, cordate or truncate at base, blade distinct from petiole and not tapered into it: fls. few, sometimes solitary in the wild, blue-violet

(to white in var. *alba*), spreading or nodding, $\frac{3}{4}$ in. or less long; corolla bell-shaped, shallowly lobed; calyx-lobes narrow, short and spreading; caps. opening at apex. Mts. of Eu.—Good garden subject; often called *C. cæspitosa* but that is a more compact plant with narrow basal lvs. tapering into the petiole; sometimes grown as *C. pusilla* which is apparently a synonym; some of the stock is dwarf races of *C. carpatica* and sometimes *C. rotundifolia*.

14. *C. collina*, Bieb. Somewhat pubescent clump-forming per. with simple sts. 1 ft. or less high, blooming most freely when two or three years old; lvs. few and very small on st. but many of them at base, thick, blades 1–2 in. long, oblong or narrower, blunt or short-pointed, margins crenate, petiole distinct; fls. few, divaricate or nodding at top of st., deep purple, about 1 in. long, bell-shaped with large recurving lobes; calyx-lobes short and broad; caps. opening at base. Caucasus.

15. *C. fragilis*, Cyr. Graceful glossy-lvd. diffuse or vine-like per., making lopping branches 12–16 in. long; lvs. cauline and basal, ovate to broad-ovate, often 1 in. across, cordate or truncate at base, notched; fls. axillary mostly toward end of branches, blue with light center, bell-shaped but opening widely; corolla lobes usually less than half way down, about 1 in. long before expansion; calyx-lobes very short, flaring; style prominent. S. Italy.

16. *C. isophylla*, Moretti. Per. with glabrous or somewhat hairy but green diffuse sts. a few in. high, the many weak long flowering branches drooping; lvs. shortly cordate-ovate, $1\frac{1}{2}$ in. long and broad, long-petioled below, point very short, margins dentate, the upper ones becoming narrower and smaller; fls. solitary on bracted branchlets, profusely borne toward the end of the sts., pale blue (but a white var.), 1 in. or more across; calyx-lobes lanceolate and prominent, wide-spreading or reflexed, equalling or exceeding corolla-tube; corolla saucer-shaped, the lobes broad, style long-exserted. Italy.—A floriferous and attractive plant; sometimes grown in pots and greenhouses.

17. *C. Poscharskyana*, Degen. Diffuse or lopping very leafy and floriferous nearly glabrous per. with many sts. and branches; lvs. long-petioled, cauline ones ovate-pointed, basal ones cordate-ovate and $1\frac{1}{2}$ in. across, margins mostly bluntly toothed to almost crenate; fls. scattered on ends of st., bright blue-lilac, broad-bell-shaped, very deeply lobed, becoming almost rotate and $\frac{1}{2}$ to almost 1 in. across; calyx spreading, the acute lobes equalling or exceeding tube of corolla. (Bears the name of G. A. Poscharsky, horticulturist and botanist in the Balkan region.) Dalmatia.

18. *C. Elatines*, L. ADRIA BELLFLOWERS in cult. Somewhat tufted much-branched floriferous per., ascending or decumbent, sts. 3–8 in. long, glabrous to pubescent; lvs. ovate or the basal ones cordate-ovate and long-petioled, large blades nearly or about 1 in. broad, margins sharply toothed; fls. many, small, $\frac{3}{4}$ in. or less across, solitary or 2–3 together in axils, making an indefinite raceme-like inf., style conspicuously exserted; corolla blue-violet to nearly azure, bell-shaped, wide open at maturity, the long lobes narrow and acute; calyx about equalling or exceeding corolla, lobes very narrow; caps. opening midway on side or near base. Italy and the Balkan region.—Geographically variable, cult. under many names; *Elatines* is an old Greek-Latin name for a kind or group of plants, now appearing in different forms in botanical nomenclature. For the group as a whole in cult. there is the recent useful name *C. Adria*, van Melle, on the assumption that hybridity occurs among the races when grown in gardens. To the *Elatines* group belong the names *C. Portenschlagiana*, Roem. & Schult., *C. muralis*, Portens., and the following: Var. *Barbeyi*, Fiori (*C. Barbeyi*, Feer), very green plant, glabrous, fls. violet-blue, lobed nearly to bottom, calyx-lobes one-half or more length of corolla, named for its cultivator William Barbey; var. *elatinoides*, Fiori (*C. elatinoides*, Moretti), white-tomentose plant of compact growth and thickish lvs.; var. *fenestrellata*, Bailey (*C. fenestrellata*, Feer), glabrous and glossy plant, fls. violet-blue, lobes very deep and recurving; var. *garganica*, Fiori (*C. garganica*, Ten.), gray-pubescent plant, light violet-blue fls. with long corolla-lobes, style not much exserted, calyx-lobes one-half or less as long as corolla; var. *istriaca*, Fiori (*C. istriaca*, Feer), tomentose plant, corolla lobed nearly to base, lobes widely spreading, style long-exserted. *C. Erinus* has been listed as an associate with *C. Elatines*, perhaps from confusion of names; true *C. Erinus*, L., is a little not showy ann. in the Medit. region, probably not in cult.

19. *C. Tommasiniana*, Reut. Floriferous glabrous very slender per. with only short side branchlets or none, 6–18 in. tall; lvs. many on sts., narrow-lanceolate, 2 in. or less long, all acute, margins not quite entire, radical lvs. none; fls. several or many toward end of sts. and slender-pedicelled, mostly nodding, pale blue; corolla tubular or subcylindric, $\frac{3}{4}$ in. or less long, lobes very short, blunt and little spreading; calyx very short, lobes divaricate. (For M. Tomasin, page 266.) Istria, in N. Adriatic.

20. *C. Waldsteiniana*, Roem. & Schult. Small usually condensed plant 3–9 in. high; lvs. many, the main ones lanceolate-acute and about 1 in. or less long, lower lvs. broad and nearly or quite obtuse; fls. relatively few, on slender pedicels, lavender-blue, small, somewhat rotate or star-shaped at expansion and the lobing deep; calyx-lobes about one-half as long as corolla-tube. (F. A. Waldstein, page 53.) Croatia, Dalmatia.

21. *C. Medium*, L. CANTERBURY BELLS. Stout erect hispid-hairy bien., $1\frac{1}{2}$ –3 or 4 ft.:

root-lvs. oblanceolate or somewhat broader, long-tapering to base, 6-10 in. long, crenate; st.-lvs. lance-oblong, 3-5 in. long, sessile and more or less clasping, crenulate and undulate; fls. erect or ascending, 1 or 2 together on stout peduncles in a long open terminal raceme, violet-blue but now in many shades; calyx with broad-lanceolate lobes one-fourth or one-third length of corolla and bearing large reflexed broad-cordate appendages; corolla inflated bell-shaped or urn-shaped, the tube in cult. plants 1 in. diam., the lobes short and flaring or somewhat reflexed; stigmas 5: caps. normally 5-celled and opening at base. (Medium: *middle-size*; a Tournefortian substantive adopted by Linnæus in apposition.) S. Eu.—The most popular of the bellflowers and now represented in many cultivars, with fls. white, pink, and various shades, and also double. Var. *calycanthema*, Nichols. (i. e. *calyx-fld.*), has the calyx developed into an outer corolla-like organ, of the same color as corolla, the appendages disappearing; of this there are two forms, each in different colors, one with outer corolla flaring or rotate, the Cup-and-Saucer race, one with the outer corolla bell-shaped, nearly or quite as long as the regular corolla and duplicating it, the Hose-in-Hose or Duplex race.

22. *C. abietina*, Griseb. & Schenk. Upright diffuse glabrous per. with slender sts. to 2½ ft. high: st.-lvs. few and scattered, linear to lanceolate and acute, 1-2 in. long, nearly entire; basal or rosette lvs. narrow-elliptic with prominent petiole, nearly or quite obtuse, blade about 1 in. long and ½ in. broad: fls. light blue, on end of long peduncles and therefore scattered, erect or ascending, long-bell-shaped with deep lobes, 1½ in. across at expansion; calyx-lobes filiform and flaring, not equalling corolla. Balkan region.—Stock grown under this name is likely to be *C. rotundifolia*.

23. *C. Rapunculus*, L. RAMPION. Per., sometimes bien., slender, erect, glabrous, 2-3 ft., the many branches strongly ascending, making a thick tap-root the first year which is sometimes used in autumn and winter, together with lvs., as salad: radical lvs. many, 4-8 in. long, the blade oval or elliptic and tapering into long petiole, margins crenulate; main st.-lvs. linear-lanceolate, long-pointed, sessile, nearly or quite entire: fls. erect or ascending, lilac, about ½ in. long, in long erect narrow racemes; calyx-lobes subulate, nearly as long as the open-bell-shaped acute-lobed corolla. (*Rapunculus*: herbalists' name, diminutive from *rapum*, turnip.) Eu.—Seldom grown as a garden vegetable; good roots are unbranched above, 2-3 in. long and ¼ in. thick at top.

24. *C. persicifolia*, L. Strong erect per., making many basal lvs., glabrous; sts. 2-3 ft., sometimes branching toward the top: radical lvs. narrowly oblanceolate, 4-8 in. long, long-tapering below, nearly or quite obtuse, crenulate, glabrous; st.-lvs. not numerous, linear-lanceolate to linear, 2-4 in. long, the lower more or less spatulate, sessile, mostly acuminate, finely crenulate: fls. erect, short-stalked and more or less remote, in an elongated terminal raceme, blue to blue-violet, 1-1½ in. long and often broader; calyx glabrous or hairy, the lobes linear-lanceolate, one-half or less the length of the broad open corolla which has broad mostly acute lobes; caps. opening on side or near top. (*Persicifolia*; *peach-leaf*, not a very appropriate name.) Eu., Asia.—An old favorite, in several colors and forms, sometimes under Latin names; basal tufts of long lvs. conspicuous in autumn. Var. *alba*, Hort., fls. white. Var. *dasycarpa*, Hegi (*C. dasycarpa*, Kit.), caps. hairy or setigerous. Var. *minor*, G. Beck, small, fls. only 1 in. or less long. Var. *Moerheimi*, Bailey, fls. white and double, showy. This distinct and separate species has been grown under several other specific names, probably because its roots have persisted while the others have died out and the labels remained.

25. *C. Trachelium*, L. Variable erect per., 2-3 ft., more or less rough-hairy; sts. usually simple, hairs mostly retrorse; lvs. ovate-lanceolate, 2-3 in. long, the lower ones long-stalked, cordate to truncate, acuminate, margins coarsely serrate, hispid-hairy at least on the veins: fls. blue-purple but running to other shades and to white, about 1 in. long, more or less inclined or drooping when fully open, 1-3 on a peduncle combined in a terminal loose raceme or panicle; corolla broad-campanulate, the lobes acute and not much spreading and more or less bearded; calyx-tube usually hispid, the lobes ovate-lanceolate, much shorter than corolla. (*Trachelium*: Greek *the neck*, supposed to cure diseases of the trachea; an old generic name.) Eu., Asia, and escaped in N. Amer.—Double-fld. forms (*flor pleno*) are known. It often appears in gardens erroneously under other specific names.

26. *C. latiloba*, A. DC. (*C. grandis*, Fisch. & Mey.). Per., 1½-4 ft., with glabrous terete but furrowed simple sts.: st.-lvs. lanceolate, 3-5 in. long and ½ in. or less broad, narrowed both ways, crenate-serrate: fls. blue (a white var.), often 2 in. across, sessile, solitary or somewhat fascicled, erect, in a terminal panicle; calyx-lobes ovate-acute, less than half as long as the open-bell-shaped broad-lobed corolla; 3 styles very long. Caucasus, Asia Minor.

27. *C. pyramidalis*, L. CHIMNEY BELLFLOWER. Strict strong glabrous per., 4-5 ft. (there is a dwarf compact form), nearly or quite simple but with many short flowering branchlets; main st. thick, pithy or hollow; radical lvs. very long-petioled, cordate-ovate, about 2 in. long, glandular-dentate; lower st.-lvs. much like the radical, upper ones narrowly ovate-acute: fls. numerous in a long narrow racemose terminal panicle, erect, pale blue and varying to white, producing a rocket-like effect; calyx-lobes nearly or quite linear, much spreading, usually not equalling the corolla-tube; corolla open and saucer-shaped, the acute lobes reaching to middle or below. S. Eu.

28. *C. carpatica*, Jacq. TUSOCK BELLFLOWER. Variable and well known glabrous and smooth per. forming a clump, with sts. more or less decumbent or spreading at base and rising 9–18 in.: basal and cauline lvs. similar but the lower ones longer-petioled, ovate, 1–1½ in. long, subcordate to truncate at base, short-pointed, crenate-dentate: fls. solitary and erect on long sts. or peduncles, bright blue (and a white var. and shades of blue to mauve), 1-nearly 2 in. across; calyx-lobes linear-acute, reflexed, short; corolla open-bell-shaped, broadly lobed to one-third or one-half the depth, the lobes acute. Carpathian region, E. Eu. Var. *turbinata*, Nichols. (*C. turbinata*, Schott), has fls. more deeply bell-shaped or top-shaped, and decumbent habit.—*C. carpatica* is one of the commonest garden bellflowers, long in cult. and variable. Old hort. names of color forms are vars. *alba*, *cærulea*, *cælestina*, *pallida*, and there are vernacular names such as Blue Star, Isabel, Mauve Cup, Moonlight, White Star. Dwarf forms are vars. *compacta*, *nana*; some of these forms are grown erroneously as *C. Raineri* (no. 10) and as *C. pseudo-Raineri*, a name without botanical standing. *C. Stansfieldii* is a hort. name for a form of *C. carpatica*, said to be a hybrid with *C. Waldsteiniana*.

29. *C. glomerata*, L. Strict hairy or glabrous per. with erect side branches, 1–2 ft.: lvs. rather thick, scabrous and rugose and more or less hairy, the radical ones very long-petioled, narrowly cordate-ovate, 4–5 in. long, obtuse, crenate; st.-lvs. ovate to ovate-oblong, 3–4 in. long, mostly sessile and more or less clasping, obtuse or short-acute, irregularly crenate-serrate: fls. many in dense clusters in the axils and terminating main st. and side branches, blue but varying to white and sometimes double in the cultivars; calyx-lobes linear, erect, shorter than corolla-tube; corolla 1 in. or less long, rather narrow-bell-shaped, with acute flaring lobes about one-half its length. Eurasia, and somewhat escaped in N. Amer. Var. *acaulis*, Rehnelt (*nana*), little tufts 3–6 in. high, lvs. narrow, fls. blue-violet; of garden origin. Var. *dahurica*, Fisch. (*speciosa*, *superba*), stout, terminal clusters 3 in. or more across, lateral clusters small; fls. pink-violet to purple; probably of garden origin.

30. *C. latifolia*, L. Strong early-blooming, very leafy per., 3–4 ft., sts. nearly simple and usually with scattered hairs: lvs. oblong-ovate to lance-ovate, the lower ones long-petioled and subcordate and 5–6 in. long, upper ones shorter-petioled and becoming narrower, all acuminate, dentate, rugose and hairy: fls. erect or ascending in a rather short leafy terminal raceme, about 1¼–1½ in. long, purplish-blue (and a white var.); calyx-lobes broad-linear and acute, ascending, about ½ in. long; corolla narrow-bell-shaped, the lobes about one-third its length: caps. opening at base. Eurasia. Var. *macrantha*, Sims, is a large-fl. form, the corolla 2–2½ in. long; plant usually taller. Var. *eriocarpa*, Fisch. (*C. eriocarpa*, Bieb.), the BRANTWOOD BELLFLOWER, has caps. tomentose.

31. *C. lactiflora*, Bieb. (*C. cellidifolia*, Boiss.). Per., 2–4 ft. and more, the sts. with a few declined hairs and branching above: lvs. oval-oblong to ovate-lanceolate, st.-lvs. 2–3 in. long, sessile, short-acute, serrate: fls. in a terminal panicle 3–4 in. long, milk-white but varying to pale blue, about 1 in. long and somewhat broader; calyx-lobes ovate, veined, more or less hispid; corolla open-bell-shaped to nearly saucer-shaped: caps. opening at base. Caucasus region.

32. *C. alliariæfolia*, Willd. Gray-pubescent per. branching at top, 1½–3 ft. high: basal lvs. large, ovate-cordate to reniform, long-petioled, crenate; st.-lvs. ovate and smaller, becoming sessile: fls. white, nodding on short stalks in the upper axils; calyx-lobes ovate and leafy, appendaged; corolla rather broad-campanulate, ciliate on margins, with a projection at the bottom of each sinus. Caucasus, Asia Minor.

33. *C. Grosseckii*, Heuff. Rough coarse erect per. to 2½ ft., with very broad radical lvs. and many hanging or divaricate violet fls. along the leafy st.: lvs. of st. ovate-lanceolate; radical lvs. reniform-ovate, 2–5 in. across, cordate, dentate: fls. 1 or more at a node and subtended by bracts or lvs., about 1 in. long, cut one-third way down, lobes acute; calyx short, bristly-hairy, with large appendages in sinuses: caps. opening at base. (Named for Rev. Caspar Grosseck, student of the flora of Banat, S. Hungary.) Hungary.

34. *C. punctata*, Lam. (*C. nobilis*, Lindl.). Stout hairy erect per., 1–2 ft., with angled sts. and many slender erect branches: basal lvs. broadly cordate-ovate, 3–5 in. long and long-petioled, sinus narrow, margins crenate- or blunt-dentate; st.-lvs. ovate to lance-ovate, sessile near the top: fls. declined from the tops of branches or stout peduncles, about 2 in. long, white to light clear lilac and mostly spotted within; corolla long-bell-shaped, lobed to about one-third the depth, ciliate with long soft hairs; calyx with an ovate appendage reflexed from each sinus or the appendage wholly wanting in some forms or departures. Siberia, China, Japan.—Now frequent in cult., particularly in the lilac-blue unspotted form or derivative Marian Gehring.

35. *C. Raddeana*, Trautv. Graceful and attractive thinly pubescent erect per. to 16 in. or less: radical lvs. cordate-ovate, slenderly petiolate, blades 1 in. and less long, obtusely dentate; st.-lvs. much smaller, ovate to lanceolate: fls. more or less secund in disposition near top of plant, nodding, amethyst-blue, bell-shaped with flaring lobes and nearly 1 in. long, style long-exserted; calyx-lobes prominent and about half length of corolla, with reflexed long appendages. (G. Radde, page 50.) Caucasus.

36. *C. longestyla*, Fomin. More or less hairy branching per., 18–30 in.: basal lvs.

lance-oval and lobed, with long winged petiole; st.-lvs. oblong and sessile; fls. hanging, amethyst-violet; calyx-lobes lanceolate-pointed and divaricate, appendages reflexed on the peduncle; corolla nearly urn-shaped, constricted below the limb or in one form bell-shaped. Caucasus.

37. *C. sarmatica*, Ker. Gray soft-pubescent per. with erect simple sts. 1-2 ft. high, lower lvs. making a radical tuft: basal lvs. arrow-shaped and acute, 3-5 in. long, with broad basal sinus and dentate margins; st.-lvs. smaller and narrower, either acute or obtuse; fls. several, well separated in terminal raceme, declined or nodding, $1\frac{1}{2}$ in. or less long, lilac; corolla narrow-bell-shaped, acutely lobed one-third the length; calyx tomentose, lobes above one-half length of corolla, with caducous appendages: caps. opening by basal pores. Caucasus (part of the ancient Sarmatia).

38. *C. Vidalii*, H. C. Wats. Odd clammy glabrous glossy-stemmed per., 1-2 ft., branching from base: lvs. oblong to oblong-spatulate, 3-4 in. long, fleshy and viscid, coarsely serrate; fls. nodding, 2 in. long, in a short terminal raceme, white with yellow at the very base; calyx-lobes thick, triangular; corolla tubular and constricted above the base. Azores, where it was discovered the middle of last century by Capt. Vidal, R. N.

39. *C. barbata*, L. Hairy erect small per. 4-18 in. high, with clump of long basal foliage and nodding lilac-blue fls.: st.-lvs. 1-3, oblong or narrower; bottom lvs. linear- to oblong-lanceolate or oblanceolate, 2-5 in. long, nearly or quite obtuse; fls. 1-6 near top of plant, about 1 in. long, short-stalked or sessile, bell-shaped, lobes one-third length of corolla which is bearded within, style not protruding; calyx-lobes broad and not elongated; caps. opening at base. Alps, S. Eu.

40. *C. rapunculoides*, L. ROVER BELLFLOWER. The commonest intro. campanula, making large patches by means of its slender rootstocks and thick tap-roots, persisting about houses and along roadsides, the colonies sometimes producing few fls., but seldom really cult.; sts. slender but erect, 2-3 ft. and more, glabrous or pubescent: root-lvs. long-petioled, cordate-ovate, 1-3 in. long; st.-lvs. lance-ovate, 3-4 in. long, short-petioled to sessile, long-acuminate, irregularly serrate; fls. blue, 1 in. long or a little more, nodding on short pedicels in a long one-sided terminal raceme; calyx-lobes turning back; lobes less than one-half depth of corolla, acute; caps. opening at base. Eu., Asia.—Becomes a weedy persistent spreading plant taking the place of other species and carrying their names with it.

41. *C. rhomboidalis*, L. Per. with erect slender angled glabrous or slightly hairy sts., 1-2 ft.: lvs. ovate and acute, 1-2 in. long, sessile or very short-petioled, dentate or serrate, with a few scattered hairs; fls. purplish-blue or lilac (a white var.), $\frac{3}{4}$ -1 in. long, usually drooping, in a slender terminal raceme of 8-10; calyx strongly ribbed, with subulate lobes nearly or quite half as long as the bell-shaped rather shallow-lobed corolla: caps. opening by basal pores. Mts. of Eu.

42. *C. rotundifolia*, L. BLUEBELL. HAREBELL. Very slender variable per. 6-20 in. and more high, glabrous but with pubescent forms, often diffuse at base: root-lvs. broadly ovate to nearly orbicular, about 1 in. across, long-petioled, often disappearing by flowering time; st.-lvs. linear and grass-like, 2-3 in. long, or the lower ones lanceolate; fls. few to several (or even solitary), in an open terminal raceme with the lower filiform pedicels elongated, hanging, bright blue (a white var. known in cult.), $\frac{1}{2}$ -1 in. long; calyx-lobes awl-shaped, one-half as long more or less as the broad-bell-shaped rather shallow-lobed corolla: caps. opening at base, Eurasia, N. Amer. Var. *soldanellaeflora*, Nichols, is semidouble with the corolla split to the base into many narrow shreds.—*C. rotundifolia* is a persistent species in cult. and it passes under many specific names that do not belong to it. Variation within the species apparently depends greatly on the habitat.

2. ADENOPHORA, Fisch. LADYBELL. Upwards of 50 per. herbs with milky juice, in Eu. and Asia.—Differs from Campanula in the cup-like or cushion-like disk or gland surrounding the base of the style, the stamens free from the corolla and filaments dilated and usually ciliate toward base; stigmas and cells of caps. 3. (Adenophora: Greek *gland-bearing*.)—The ladybells are much like the bellflowers or Campanulas in general appearance but more slender in growth, often much-branched, with declined or hanging corollas in shades of lilac-blue. They are largely inhabitants of cool northern regions, yet easy of cult. They have fleshy roots. Species and names in gardens are confused.

A. Calyx-lobes distinctly cut or lobed lengthwise.....1. *A. Potaninii*

AA. Calyx-lobes not cut or denticulate.

B. Cauline lvs. very narrow and long, 3-4 in., margins entire or remotely denticulate.

BB. Cauline lvs. short and relatively broad, lanceolate to ovate, margins various.

c. Margins of cauline lvs. with small close mostly obtuse serratures.....3. *A. confusa*

cc. Margins of cauline lvs. with large acute irregular teeth.....4. *A. polymorpha*

1. **A. Potaninii**, Korsh. Root thickened; sts. many, perhaps oblique at base then upright to 2 ft. and more: st.-lvs. ovate-lanceolate to lanceolate, 1-2 in. long, nearly entire to few-toothed: infl. racemiform and simple; fls. 1-3 at a node on very short pedicels, spreading or nodding, blue or lilac, narrow-bell-shaped, about $\frac{3}{4}$ in. long and somewhat broader at expansion and lobed one-third to base; calyx-lobes lanceolate, toothed or cut, about one-third to one-fourth as long as corolla. (Collected in 1885 by G. N. Potanin.) W. China.

2. **A. coronopifolia**, Fisch. Diffuse slender branching per. 2-3 ft. high, with ascending branches from a more or less horizontal st.: lvs. long and narrow, 3-4 in. long and $\frac{1}{4}$ in. or less broad, mostly narrowed to short petiole, margins nearly entire to remotely small-toothed: fls. many in racemiform clusters on main st. and laterals, lilac-blue, declined or nodding, nearly or quite 1 in. long, bell-shaped, lobed about one-third way down; calyx-lobes about one-fourth length of corolla. Manchuria.

3. **A. confusa**, Nannf. (*A. Farreri*, Nannf.). Root fleshy; sts. simple or branched at top, 18 in. or less high: root-lvs. reniform and dentate; st.-lvs. narrow-ovate to oval, $1\frac{1}{2}$ in. or less long and 1 in. broad, short-acute, margins closely serrate; fls. hanging, lilac-blue, in racemose formation, $\frac{3}{4}$ in. or less long, broadly bell-shaped, lobed about one-third to base; calyx-lobes very narrow and short. China.

4. **A. polymorpha**, Ledeb. Root thick and fleshy; sts. stout, erect or arching, to 3 ft., branching: st.-lvs. lanceolate to broad-lanceolate, about 2 in. long and $\frac{1}{2}$ in. broad, acute, margins sharply coarsely dentate: fls. nodding in racemiform order on main st. and branches, lilac-blue, bell-shaped, very shallowly lobed; calyx-lobes very narrow, spreading, short. Russia, E. Asia.

3. **SYMPHYANDRA**, A. DC. RING BELLFLOWER. About 8 per. and bien. herbs from the E. Medit. region and 1 from Asia.—Differs from *Campanula* in having the anthers united in a tube around the style (whence *Symphyan-dra*, *anthers grown together*); stigmas and cells of caps. 3.

A. Cauline lvs. gradually narrowed into winged petiole. 1. *S. Hofmannii*
 AA. Cauline lvs. not tapered at base, petiole slender and not winged to base. 2. *S. pendula*

1. **S. Hofmannii**, Pant. Sts. branched, 1-2 ft., hispid-hairy, per. said sometimes to be bien.: lvs. oblanceolate to obovate, 4-7 in. long on the lower part and tapering to long winged base, shorter and becoming sessile on the upper part, toothed, hairy: fls. in terminal leafy panicles, white, drooping, 1-1 $\frac{1}{2}$ in. long and of similar breadth; calyx-lobes auricled at base, leafy, half or more length of corolla-tube; corolla open-bell-shaped, shallowly broad-lobed, somewhat hairy inside; stigmas 3, exserted. (Dedicated to Florence Hofmann.) Bosnia.

2. **S. pendula**, A. DC. Small per. usually of many sts., 1 ft. or less high: radical lvs. ovate to truncate-reniform, $1\frac{1}{2}$ in. or less across, irregularly serrate-dentate; cauline lvs. mostly ovate, blade about 1 in. long, broad or not long-tapered at base, coarsely serrate: fls. large, white, bell-shaped, about 1 in. or more long, broadly lobed to nearly one-half its depth; calyx-lobes long and broad, one-half or more length of corolla. Caucasus.

4. **SPECULARIA**, Heister. About 10 or 12 ann. herbs in the northern hemisphere, one grown in fl.-gardens.—Differs from *Campanula* primarily in the elongated cylindric or prismatic ovary with calyx-lobes prominent at its apex as well as in the prevailing rotate corolla; stigmas and cells of ovary 3. (*Specularia*: derived from Latin *speculum*, a mirror.)

S. Speculum, A. DC. (*Campanula Speculum*, L. *S. Speculum-Veneris*, Caruel). VENUS LOOKING-GLASS. Nearly or quite glabrous branching ann. 9-15 in. high: lvs. alternate, oblong to spatulate, $1\frac{1}{2}$ in. or less long, narrowed below or upper ones sessile, mostly obtuse, crenulate: fls. 1-3 on peduncles in all the upper axils, bright violet-blue varying to white and double, the rotate corolla about $\frac{3}{4}$ in. across; calyx-lobes narrow and prominent, reaching or surpassing the corolla-sinuses; often bracts at base of long ovary much like corolla-lobes. Cent. Eu. and Medit. region.

5. **CODONOPSIS**, Wall. Asian small herbs, often with strong smell; species 40-50.—Low perennials with milky juice and often tuberous roots, the cult. species vine-like in growth: fls. bell-shaped, in blue, purple, white, yellowish, commonly nodding; corolla 5-lobed, glandular disk lacking; stamens 5, free from corolla: fr. a caps., opening at top between the large calyx-lobes, with conspicuous beak. (*Codonopsis*: Greek *bell-like*.)

C. clematidea, Clarke (*C. ovata*, Hort. not Benth.). Sprawling decumbent thinly pubescent slender plant, upright when young, mature sts. to 2 ft. or more long becoming much-branched: lvs. alternate or subopposite, $\frac{3}{4}$ in. or less long, ovate to lance-ovate, cordate to

subcordate at base, apex blunt or nearly so: fls. borne singly from axils and apices, broad-bell-shaped, 1 in. long, light lilac and purple markings inside; calyx prominent with flaring broad lobes. Cent. W. Asia.

6. **PLATYCODON**, A. DC. One showy per. in E. Asia, common in cult.—Distinguished from *Campanula* by caps. opening at the top by means of valves rather than on the sides or at base by means of lids or other separate openings; stamens much dilated at base, the anthers not united; stigmas 5 and caps. 5-celled. (*Platyodon*: Greek *broad bell*, from the shape of the fls.)

P. grandiflorum, A. DC. (*Campanula grandiflora*, Jacq.). BALLOON-FLOWER (from the inflated buds). Sts. erect, branched above, glabrous, $1\frac{1}{2}$ – $2\frac{1}{2}$ ft.: lvs. ovate to ovate-lanceolate, 1–3 in. long, short-petioled, usually acute, sharp-dentate, glabrous, glaucous-blue beneath: fls. mostly solitary terminating long branches or peduncles, 2–3 in. across, dark rich blue to pale blue or lilac to white; calyx-lobes narrow, $\frac{1}{4}$ – $\frac{1}{2}$ in. long; corolla open-bell-shaped or deep-saucer-shaped, with 5 or sometimes more broad acute lobes. Var. **Mariesii**, Nichols., is a dwarf form 12–18 in. high, compact, the fls. large; sent from Japan to England by Maries. Var. **japonicum**, Dreer, is a strong bushy tall form with about 10 lobes to corolla, giving a stellate effect.

7. **WAHLENBERGIA**, Schrad. TUFTY BELLS. Small plants of wide distribution about the earth but mostly of southern hemisphere.—Per. herbs (sometimes grown as annuals) with the general appearance of *Campanula* but pod or caps. opening by valves at apex between adhering calyx-lobes rather than by slits or pores on side or at base, ovary being partially or wholly inferior: lvs. varying from broad to linear, in cult. kinds more or less clustered at base: fls. bell-shaped to rotate, violet-blue to purplish, erect or nodding, usually borne singly and not in involucrate heads. (*Wahlenbergia*: George Wahlenberg, 1780–1851, Swedish botanist.)

- A. Corolla bell-shaped: fl.-st. simple and scape-like from a tuft of radical lvs., fls. solitary, lvs. on st. none. 1. *W. albomarginata*
 AA. Corolla rotate or nearly so: fl.-st. forking or branched, sometimes leafy.
 B. St.-lvs. many and conspicuous, at least on lower half. 2. *W. vineæflora*
 BB. St.-lvs. none or only a few bracts. 3. *W. annularis*

1. **W. albomarginata**, Hook. f. Lvs. in a basal tuft, lanceolate to spatulate, about 1 in. long, obscurely denticulate: scape 1–10 in. high, erect, very slender, leafless; fl. at top of scape, nearly or quite erect, $\frac{3}{4}$ in. or more long and usually 1 in. or more across, white to violet-blue, bell-shaped; corolla-lobes broad, to nearly one-half the depth. New Zeal.—The plant sometimes cult. as *W. tasmanica* is probably *W. saxicola*, Hook. f., a lower subject with fls. $\frac{1}{2}$ in. or less across.

2. **W. vineæflora**, Decne. Slender, erect, 9–20 in. high, making an open or diffuse tuft, sts. branched at least toward base: lvs. oblong to spatulate, 1–2 in. long, basal and cauline, often undulate: fls. 1 or more to a st., erect or nodding, white to light blue, open to nearly rotate, about 1 in. across; corolla lobed one-half or more the way down. Australia, New Zeal.

3. **W. annularis**, A. DC. Branching, diffuse, 8–24 in. high: lvs. in basal tufts, linear-lanceolate or narrower, 1–2 in. long, more or less denticulate, represented on the st. if at all by linear bracts: fls. several to each st., deeply lobed and nearly rotate, about 1 in. across, opening white changing to light violet, spots on inside. S. Afr.

8. **EDRAIANTHUS**, A. DC. GRASSY BELLS. Group of tufted perennials of perhaps a dozen species; useful compact rock-garden plants.—Often included in *Wahlenbergia* but technically distinguished by the caps. that opens irregularly rather than by compartments and for the most part with grass-like tufted lvs., and fls. prevailing in close involucrate heads or subtended by bracts; they also inhabit a different part of the world, all European chiefly Balkan, probably with a different line of evolution: fls. bell-shaped to trumpet-shaped, purplish or violet. (*Edraianthus*: *sessile flowers*.)—Sometimes but not originally written *Hedraianthus*.

- A. Bloom borne singly at end of short branches.
 B. Fl. sessile in upper lvs. 1. *E. Pumilio*
 BB. Fl. stalked above bracts or involucre.
 C. Lvs. hairy on upper face: lobes of corolla acute. 2. *E. dinaricus*
 CC. Lvs. glabrous on both faces: lobes of corolla nearly or quite blunt. 3. *E. serpyllifolius*
 AA. Bloom compacted into involucrate heads.
 B. Calyx bearing a minute auricle or lobe in each sinus. 4. *E. Kitaibelii*
 BB. Calyx without auricles.
 C. Lobes of calyx as broad as long. 5. *E. dalmaticus*
 CC. Lobes of calyx long and narrow. 6. *E. tenuifolius*

1. *E. Pumilio*, A. DC. (*Wahlenbergia Pumilio*, A. DC.). Somewhat hairy-pubescent condensed low plant 2-4 in. high: lvs. close together, narrow-linear, $1\frac{1}{2}$ in. or less long: fls. erect just above the foliage, amethyst-violet, narrow-bell-shaped, 1 in. long or less, flaring lobes acute; calyx-lobes one-third to one-half as long as corolla, acute, spreading. (Pumilio: Latin a dwarf.) Dalmatia, upper Adriatic region.

2. *E. dinaricus*, Wettst. Low open grower a few in. high: lvs. grass-like, both basal and cauline, 1-2 in. long, hirsute on upper face: fls. above the foliage, placed singly but subtended by calyx-like bracts, nearly 1 in. long, erect, violet-blue, lobes acute and not reflexed, twice or more length of broad hairy calyx-lobes. Dinaric Alps, Dalmatia.

3. *E. serpyllifolius*, A. DC. (*Wahlenbergia serpyllifolia*, G. Beck). Compact and mat-forming, spreading, very low: lvs. linear-spatulate, glabrous: fls. open-bell-shaped, large, violet, broad lobes more or less obtuse; calyx-lobes about one-fourth length of corolla. Dalmatia and adjacent regions.

4. *E. Kitaibelii*, A. DC. (*Wahlenbergia Kitaibelii*, A. DC.). Low, tufted, few in. high: lvs. fascicled, narrow-linear, nearly or completely glabrous: fls. blue-violet, in compact heads above the foliage, tubular-bell-shaped with broad short erect lobes; calyx-lobes pointed, with small auricle in each sinus. (P. Kitaibel, page 46.) Transylvania.

5. *E. dalmaticus*, A. DC. (*Wahlenbergia dalmatica*, A. DC.). Tufted, 4-6 in. high: lvs. linear-spatulate, more or less ciliate on margins: fls. violet-blue, tubular-bell-shaped, short broad lobes nearly or fully obtuse, 6-10 of them compacted in a terminal head subtended by long involucrel lvs.; calyx-lobes short, broad and obtuse. Dalmatia and Croatia.

6. *E. tenuifolius*, A. DC. (*Wahlenbergia tenuifolia*, A. DC.). Compact and mat-forming, 4-6 in.: lvs. long-linear, glabrous: fls. violet-blue, large, 6-15 of them in dense head subtended by narrow lvs. exceeding it, lobes short and nearly obtuse; calyx-lobes slender, about equalling corolla-tube. Montenegro and adjacent regions east of the Adriatic Sea.

9. **MICHAUXIA**, L'Her. Few odd plants of W. Asia, ours per. but reputedly bien.—Erect, tall: lvs. narrow, scattered on st., toothed or lobed: fls. with 8-10-parted corolla, the narrow lobes recurved, borne singly on end of branches and on short laterals; calyx with 8-10 short flaring acute lobes; stamens 8-10, short, anthers linear and recurved; ovary inferior, 8-10-celled; styles united into long projecting tube bearing stigmas in a head-like end: caps. hemispheric, crowned with dead floral parts, opening near base. (Michauxia: André Michaux, page 48.)

M. campanuloides, L'Her. Rough-hairy plant with stout straight side-branched sts. to 4 or 6 ft., and tap-root: lvs. lyrate, clasping, 5-8 in. long: fls. scattered but abundant on nearly leafless branches, white more or less tinged purplish on back, 2 in. or more long from tip of reflexed corolla-lobes to end of prominent exserted style.

10. **TRACHELIUM**, L. THROATWORT. Per. erect often more or less woody herbs, of few species in Medit. region.—St.-lvs. alternate: fls. small, tubular, in terminal branched corymbiform clusters; corolla 5-lobed; stamens 5, free from tube: caps. subglobose and angled, opening near base. (Trachelium: Greek name for neck, from supposed remedial value for throat diseases; see *Campanula Trachelium*, page 963.)

T. cæruleum, L. Leafy glabrous plant 3-4 ft. high, widely branching toward top: lvs. ovate to elliptic, to 3 in. long, petiolate, margins bluntly toothed: fls. many, deep blue, in clusters 2-4 in. across; corolla about $\frac{1}{4}$ in. long, lobes obtuse; style conspicuously long-exserted. S. Eu.

11. **PHYTEUMA**, L. HORNED RAMPION. Per. mostly erect herbs, sometimes decumbent; several species in Eu. and temp. Asia.—Sts. usually simple: radical and cauline lvs. different: fls. (in ours) in close subtended terminal heads or spikes, shape obscure because of crowding; corolla blue, purplish or white, relatively small, 5-parted at bottom (like basal slits or pores) but tubular and commonly curved in upper part, each with a single long-exserted 2-3-lobed style: caps. inferior, closed at apex, opening on side between ribs. (Phyteuma: classical name of no special significance.)—In the following species the fls. are in compact globose heads or umbels rather than in elongated spikes.

A. Plant very low and decumbent: lvs. broad and deeply toothed. 1. *P. comosum*

AA. Plant erect even though low: cauline lvs. narrow, entire or nearly so.

B. Lvs. very narrow, grass-like, entire: plant very low. 2. *P. hemisphaericum*

BB. Lvs. lanceolate or broader, usually more or less dentate: plant 1 ft. or more high.

c. Apex of lvs. produced into long narrow point.....3. *P. Scheuchzeri*

cc. Apex of lvs. not so produced.

d. Blade of cauline lvs. tapered to base.4. *P. orbiculare*

dd. Blade of lower cauline and radical lvs. truncate or cordate at base.....5. *P. Vagneri*

1. *P. comosum*, L. Glabrous, decumbent, diffuse, 3-6 in. high: radical lvs. orbicular to reniform, notched; st.-lvs. ovate to elliptic, sometimes cordate, deeply notched, about 1 in. long, upper ones nearly lanceolate: fls. lilac to dark purple, in a close head or umbel among the foliage, slender style long-exserted. Alps.

2. *P. hemisphaericum*, L. Little condensed plant, 4-6 in., erect, with upright linear entire pointed lvs. nearly or quite as high as the st.: fls. blue varying to whitish, in dense globular or oval short-bracted heads. Alps.

3. *P. Scheuchzeri*, All. Loose-growing, to 1½ ft.: basal lf.-blades short and broad and sometimes cordate; st.-lvs. 2-4 in. long and with well-developed petiole, long-attenuate to slender point, mostly obscurely toothed; fls. violet-blue, in dense heads subtended by lf.-like bracts. (J. J. Scheuchzer, page 961.) Mts., S. E. Eu.

4. *P. orbiculare*, L. Tall stout glabrous plant to 2 ft. high: radical lf.-blades broad-oval to elliptic and ½ in. broad, not very acute, margins obscurely and bluntly serrate; st.-lvs. 2-4 in. long with petiole, blade perhaps ¼ in. broad, hardly acute: fls. purple, in dense global short-bracted heads. Alps.

5. *P. Vagneri*, Kerner. Upright: radical or lower lvs. long-petioled and cordate, toothed; st.-lvs. sessile and lanceolate to linear: fls. dark violet, in dense globose but elongating heads. (Named for its collector, L. Vagner.) Hungary.—Plants grown under this name may not be true.

12. *JASIONE*, L. Little or medium herbs, of several species in Cent. and S. Eu.—Bien. or ann., erect, diffuse or prostrate: lvs. simple, small, alternate, entire, with rosette at base: fls. in dense briefly involucrate terminal heads, blue varying to white; corolla and calyx cut into 5 very narrow lobes; anthers more or less united at base: caps. inferior, open by short valves at apex. (Jasio-ne: classical name with suggestion of healing qualities.)

A. Lvs. ½ in. or less long: plant 9 in. or less high1. *J. humilis*
AA. Lvs. more than 1 in. long and abundant: plant 1 ft. and more high2. *J. perennis*

1. *J. humilis*, Loisel. Per. 6-9 in. high, congested at base, sts. simple: lvs. crowded on lower parts, linear to somewhat oblong-linear, entire, about ½ in. or less long: fls. blue, in small compact heads above the foliage on a peduncle. Pyrenees.

2. *J. perennis*, Lam. Per., often branching, 1-1½ ft. high: lvs. many scattered on st., broad-linear to oblong-linear on the sts., blunt or nearly so, often obscurely serrate; fls. blue, in long-peduncled terminal and lateral heads: basal lvs. and offsets usually prominent. S. Eu.

13. *OSTROWSKIA*, Regel. GIANT BELLFLOWER. Great Asian per., 1 species in Bokhara, Turkestan.—Known by its broad long lvs., its terminal cluster of very large upstanding fls., many-parted calyx, open-bell-shaped corolla with 8 flaring broad lobes, caps. woody, bearing the long calyx-lobes and opening by several lateral slits. (Ostrow-skia: bears the name of N. ab Ostrowsky, patron of science.)

O. magnifica, Regel. Erect to 5 or 8 ft., from tuberous roots, glabrous, stout, branching at top, juice milky: lvs. 4-5 at each node passing into bracts toward the top, blades oblong-acute or broader, 4-6 in. long, narrowed to base, dentate: fls. pale lilac, 4-6 in. across; calyx-lobes narrow, one-half or more as long as corolla.—Apparently an uncertain plant in cult. in many parts of N. Amer.; seeds often not available and sometimes not true to name. It is a good summer bloomer in B. C. to Ore.

193. LOBELIACEÆ. LOBELIA FAMILY

Herbs or in trop. regions rarely shrubs or trees, often with acrid milky juice; about 20 genera and 600 species widely distributed, some grown for their bright showy fls.—Lvs. alternate or basal, simple, entire, toothed or pinnately parted: fls. solitary, spicate, racemose or paniculate; calyx-limb 5-lobed or -parted, the lobes equal or unequal; corolla gamopetalous, irregular, often bilabiate, its tube often open on one side nearly or quite to base, its limb 5-lobed; stamens 5, inserted with the corolla; filaments sometimes forming a tube; anthers united around the style; ovary inferior, 2-5-celled, stigma fringed: fr. a caps. or berry, with numerous seeds.—Often united with Campanulaceæ; separated primarily by the ring or tube formed by the union of the anthers and by the very irregular corolla.

Fig. 193. LOBELIACEÆ. *Lobelia Erinus*: a, flowering branch, $\times \frac{1}{2}$; b, flower, $\times 2$; c, same, vertical section, $\times 2$; d, flower, less perianth, $\times 4$; e, ovary, cross-section, $\times 8$.

- A. Corolla-tube split to base on one side.
 B. Fr. a dehiscent caps.: fls. (in ours) in racemes or spikes 1. LOBELIA
 BB. Fr. an indehiscent berry: fls. solitary 2. PRATIA
 AA. Corolla-tube not split 3. DOWNINGIA

1. **LOBELIA**, L. Ann. or per. fl.-garden and border plants; species 250 or more, in many parts of the world, well represented in E. U. S.—Mostly herbs, some trop. species somewhat woody: lvs. alternate, the cauline sometimes reduced to bracts: fls. blue, red, yellowish or white, in terminal racemes, spikes or panicles, or solitary; calyx with short or globular tube and short teeth; corolla-tube split to the base on one side, the limb with 5 lobes, the 3 on the lower side forming a lip, the other 2 (1 on either side of the cleft) erect or turned back; anthers united into a tube or ring around the style, 2 or all hairy at tips; ovary 2-celled, many-ovuled; fr. a 2-valved caps. (Lobe-lia: Matthias de Lobel or L'Obel, 1538–1616, a Flemish botanist and author.)

- A. Lower lvs. cut or divided.
 B. Plant glabrous 1. *L. gracilis*
 BB. Plant pubescent 2. *L. tenuior*
 AA. Lower lvs. not cut or divided.
 B. Plant diffuse and half-trailing, 1 ft. or less high 3. *L. Erinus*
 BB. Plant erect, to 2 ft. and more.
 C. Color of fls. blue or purplish (sometimes varying to white).
 D. Fls. to $\frac{1}{4}$ in. long 4. *L. inflata*
 DD. Fls. $\frac{3}{4}$ –1 in. long 5. *L. siphilitica*
 CC. Color of fls. red (rarely white).
 D. Lobes of corolla united at tips 6. *L. Tupa*
 DD. Lobes of corolla not so.
 E. Lower lip notched, corolla cylindrical 7. *L. laxiflora*
 EE. Lower lip deeply 3-lobed and deflexed.
 F. Bracts mostly very narrow, the upper little exceeding the pedicels:
 plants glabrous or nearly so 8. *L. cardinalis*
 FF. Bracts more leafy: plant mostly pubescent 9. *L. fulgens*

1. ***L. gracilis***, Andr. Slender glabrous ann. decumbent at base, 1 ft. or less high: lower lvs. ovate, deeply cut, the upper narrower and pinnatifid, becoming linear and entire at top of st.: fl.-cluster long and open, more or less one-sided; fls. $\frac{1}{2}$ – $\frac{3}{4}$ in. across, blue with a whitish eye, the middle lower corolla-lobe strongly obovate, the 2 upper lobes small and curved and usually hairy; anthers all bearded. New S. Wales.

2. ***L. tenuior***, R. Br. Erect or ascending ann., with slender sparsely leafy branches, 12–18 in. high, pubescent: lower lvs. small, mostly ternately parted or divided; upper lvs. linear or lanceolate, mostly entire: fls. about 1 in. long, bright blue, borne far apart on long slender pedicels; middle corolla-lobe obovate, much larger than the others; anthers all bearded. W. Australia.

3. ***L. Erinus***, L. Diffuse and half-trailing ann., 6–12 in. high, glabrous or slightly hairy below, the slender branching sts. leafy throughout: lower lvs. obovate or spatulate, crenate-toothed, very obtuse; upper lvs. oblanceolate or oblong (becoming linear and acute near the top of the st.), mostly sharp-angled: fls. $\frac{1}{2}$ – $\frac{3}{4}$ in. across, on slender pedicels; calyx-segms. awl-like, spreading, as long as the corolla-tube; corolla light blue or violet with white or yellowish throat, the 3 lower lobes large and spreading; the 2 lower anthers bearded. (*Erinus*: ancient name of a plant of this habit, used also as a generic name in Scrophulariaceæ.) S. Afr.—One of the commonest ann. edging plants. Exceedingly variable in habit, in color of foliage and color and size of fls. The dense low-growing forms are used for low close edgings, as vars. *compacta* and *pumila*; the forms with long slender sts., as vars. *gracilis* and *pendula*, are suitable for vases or baskets. Other strains have yellowish or bronzy foliage. Still other kinds have fls. white, crimson, rose, blue or purplish, one being double-fl'd. Var. *speciosa* has large azure-blue fls. with a white eye.

4. *L. inflata*, L. INDIAN TOBACCO. Hairy ann. 1-3 ft. high: lvs. oval or ovate-lanceolate, obtuse or the upper acute, toothed: fls. light blue, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, rather far apart in loose spike-like racemes; calyx inflated in fr., with linear lobes as long as corolla; lower lip of corolla shorter than tube. Lab. to Ga. and Ark.

5. *L. siphilitica*, L. Strong weedy per. 2-3 ft. high, glabrous or with scattered hairs, sts. mostly simple, leafy throughout: lvs. thin, oblong-oval to lanceolate, tapering to both ends, wing-petioled or sessile, bluish at apex, crenate-denticulate or irregularly toothed, the longest 5-6 in. long: fls. deep blue or purplish (a var. has nearly white fls.), in a long wand-like narrow-bracted racemose spike; calyx hairy, enlarging in fr., the lance-acuminate lobes conspicuous, the sinuses with an auriculate appendage; corolla about 1 in. long, the tube half as long, the lower lip 3-lobed and deflexed, the upper lip very small; larger anthers naked at tip. Me. to La.

6. *L. Tupa*, L. Erect per. or subshrub 4-7 ft. high: lvs. oblong-oval, acuminate, finely toothed, tomentose and wrinkled: fls. blood-red, 2 in. long, on long pedicels in large terminal racemes; calyx-lobes shorter than tube; lip curving downward and lobes united at tip; column of stamens ascending. (Tupa: vernacular name for this plant.) Chile.

7. *L. laxiflora*, HBK. Branching per. or subshrub 2-5 ft. high, grown mostly under glass, with thinly hairy sts.: lvs. nearly sessile, lanceolate or ovate-lanceolate, acuminate, sharp-denticulate: fls. red and yellow, pubescent, cylindric, $1\frac{1}{2}$ in. long, on long axillary pedicels, the stamens projecting from one side; lower lip notched, upper lip 2-parted. Mex. Var. *angustifolia*, DC. (*L. Cavanillesii*, Hort.), lvs. long and narrow, sometimes even linear; corolla $1\frac{1}{4}$ in. long, scarlet with yellow lip.

8. *L. cardinalis*, L. CARDINAL-FLOWER. INDIAN-PINK. Straight-growing per. 2-4 ft. high, usually unbranched and glabrous: lvs. short-petioled or sessile, oblong-ovate to oblong-lanceolate, acute or acuminate, irregularly serrate or serrulate: fls. intensely bright cardinal (rarely varying to white), in a long narrow-bracted racemose spike; calyx-tube hemispherical, much shorter than the subulate-linear lobes; corolla-tube 1 in. long, the 3 lower lobes very narrow and deflexed; larger anthers naked at tip. N. B. to Fla. and Tex.

9. *L. fulgens*, Willd. Per. 2-3 ft. high, grown under glass and planted out, usually pubescent, variously tinged with brown or bronze, sts. sending out short offsets at base: lvs. sessile, lanceolate, pointed, somewhat toothed, the lower 3-4 in. long: bracts of infl. leafy, often three to four times as long as the pedicels: fls. about $1\frac{1}{2}$ in. long, deep red, showy; calyx-segms. linear, pointed, about as long as corolla-tube; corolla with 3 broad deflexed lobes. Mex.

2. *PRATIA*, Gaud. Prostrate or creeping herbs, of nearly 20 species native Asia to Australia and S. Amer.—Differs from *Lobelia* primarily in the fr. which is an indehiscent berry crowned by the persistent calyx-lobes: fls. solitary in the axils. (Pratia: named for Prat-Bernon, who made a journey with Freycinet in 1817-1820.)

P. angulata, Hook. f. Per., sts. creeping and rooting, to 1 ft. long, glabrous or nearly so: lvs. ovate-oblong to orbicular, to $\frac{1}{2}$ in. long, short-petioled: fls. white streaked with purple, $\frac{1}{3}$ - $\frac{2}{3}$ in. long, on long erect peduncles; corolla with short tube, 2-lipped, the 3 lower lobes spreading: berry reddish-purple, $\frac{1}{2}$ in. across. New Zeal.

3. *DOWNINGIA*, Torr. Low annuals with showy fls., interesting as pot-plants or for edgings; species about 13, mostly in Ore. and Calif., 1 in Chile.—Lvs. alternate, entire, passing above into bracts: fls. blue, violet, yellow or white, sessile in the axils of the lvs. or bracts; corolla-tube short, not split, the bilabiate limb with the upper lobes much narrower than the 3 lower ones; stamens free from corolla; ovary 2-celled or by the disappearance of the thin division wall 1-celled: caps. linear, dehiscent lengthwise by 1-3 valves or fissures, bearing at its apex the leafy linear calyx-lobes; seeds smooth, small, numerous. (Downingia: after Andrew Jackson Downing, 1815-1852, American horticulturist.)

A. Lower corolla-lip concave; stamen-column much-exserted, the anther-tube nearly hook-shaped. 1. *D. elegans*
 AA. Lower corolla-lip plane; stamen-column little or not at all exserted, the anther-tube straight or only slightly curved. 2. *D. pulchella*

1. *D. elegans*, Torr. (*Clintonia elegans*, Dougl.). Sts. usually simple, 4-7 in. or more high: lvs. oblong to oblong-lanceolate, $\frac{1}{2}$ -1 in. long: corolla light blue with darker veinlets, the palate of the lower lip white with 2 green or yellowish spots and yellow lines; upper lip cut two-thirds of the way down, the lower with 3 parallel lobes at apex; stamen-column long-exserted, the down-curved anther-column almost hook-shaped and with 2 bristles on the lower side. Calif. to Wash.

2. *D. pulchella*, Torr. (*Clintonia pulchella*, Lindl.). Erect or ascending, 2-10 in. high: lvs. oblong-ovate or narrower, $\frac{1}{2}$ in. long: calyx-limb rotate, the 5 lobes blunt; corolla deep

blue; center of lower lip white with 2 yellow and 3 purple spots; corolla-tube short, the upper lip deeply 2-cleft into oblanceolate lobes, the lower lip wide-spreading, deeply cleft into 3 broad lobes; stamen-column little or not at all exserted, the anther-tube nearly straight, with 2 short bristles at apex. Calif. and Ore.

Fig. 194. COMPOSITÆ. A, *Aster tanacetifolius*: Aa, flowering branch, $\times \frac{1}{2}$; Ab, disk-flower, $\times 2$. B, *Chrysanthemum rubellum*: Ba, flowering branch, $\times \frac{1}{2}$; Bb, ray-flower, $\times 1$; Bc, same, corolla partially excised, $\times 2$; Bd, disk-flower, $\times 3$; Be, same, corolla expanded to show syngenesious stamens, $\times 3$. C, *Cichorium Intybus*: Ca, flowering branch, $\times \frac{1}{2}$; Cb, ray-flower, corolla partially excised, $\times 2$; D, *Gerbera Jamesonii*: Da, head, $\times \frac{1}{2}$; Db, ray-flower, corolla partially excised, $\times 2$; Dc, disk-flower, $\times 2$. E, *Helianthus annuus*: Ea, flowering branch, $\times \frac{1}{4}$; Eb, segment of receptacle bearing disk-flowers, ray-flowers and interfloral bracts, $\times 2$; Ec, disk-flower, $\times 2$.

Fig. 195. COMPOSITÆ. A, flowering branch *Tagetes patula*, $\times \frac{1}{2}$. B, *Calendula officinalis*: Ba, flowering branch, $\times \frac{1}{2}$; Bb, anthers, $\times 8$; Bc, ray-flower, $\times 1$; Bd, disk-flower, corolla expanded, $\times 2$; Be, seeds, $\times 3$. C, *Ageratum Houstonianum*: Ca, flowering branch, $\times \frac{1}{2}$; Cb, anthers, $\times 8$; Cc, disk-flower, $\times 3$; Cd, same, corolla expanded, filaments excised, $\times 3$. D, *Centaurea montana*: Da, flowering branch, $\times \frac{1}{2}$; Db, ray-flower, $\times 1$; Dc, disk-flower, $\times 1$; Dd, style and syngenesious stamens of disk-flower, $\times 2$. E, *Echinops exaltatus*: Ea, flowering branch, $\times \frac{1}{2}$; Eb, 1-flowered inflorescence, $\times 1$; Ec, flower, $\times 1$.

194. COMPOSITÆ. COMPOSITE FAMILY

A vast family represented in all parts of the world, deriving its name from the many blossoms (or florets) combined into an involucre head, as if they were inclosed in a single calyx and constituted a compound or composite fl.; mostly ann. and per. herbs, but a few are woody but not usually true trees; many genera are

COMPOSITÆ

prized among ornamentals, mostly in the open garden, and several others yield kitchen-garden vegetables; the genera are upwards of 800, and the known species are probably 20,000.—Plants erect or twining or drooping, sometimes with milky juice, often with strong aromatic qualities: lvs. very various, alternate, opposite or whorled, without stipules: fls. bisexual or unisexual, aggregated into small or large compact heads (known to gardeners as “flowers”); corolla gamopetalous, 4–5-lobed or -toothed, either all regular or all ligulate (produced into a long limb on one side) or the interior ones regular and the marginal ones ligulate and constituting rays to the head; in some cases the corolla is 2-lipped; stamens 4 or 5, alternating with the corolla-lobes, joined by their anthers to form a ring around the style (syngenesious), the 2 long stigmas projecting; ovary 1, inferior, 1-celled: fr. an achene (“seed” of gardeners), usually crowned by a pappus (representing the calyx-limb) comprised of scales, barbs, hairs or plumes: the fls. are borne on a variously modified and enlarged receptacle, each one subtended by a scale or bract or in many cases the receptacle naked.—The Compositæ represent a generalized group, only few of the species being highly specialized. For the most part they have not been greatly modified and confused by cult., the marked exceptions being *Chrysanthemum*, *Dahlia*, *Callistephus*, *Zinnia* and *Lactuca*. They constitute a “natural” family. Keys 1 and 2 comprise a guide to the tribes and to their accounted genera and are based on the more fundamental but often technical and minute characters. Key 3 is provided as a more artificial guide based on more obvious characters by which the genera, as delimited by the species here treated, may be determined.

1. KEY TO THE TRIBES (leads to Key 2).

COMPOSITÆ

- BB. Heads without true rays (marginal disk-corollas or inner involucre bracts sometimes enlarged and ray-like).
- C. Marginal disk-corollas enlarged, resembling ray-fls.; involucre bracts in many series: tips and margins of lvs. and of involucre bracts often spinose.
- D. Receptacle bristly or chaffy; fls. sometimes yellow; anthers tailed at base.....12. CYNARA TRIBE
- DD. Receptacle naked; fls. never yellow; anthers not tailed.....13. VERNONIA TRIBE
- CC. Marginal disk-corollas not enlarged nor resembling true rays.
- D. Lvs. opposite, never spinose: fls. regular, all alike; anthers not tailed at base.
- E. Plants with heads clustered; disk-fls. never yellow nor elongated...11. EUPATORIUM TRIBE
- EE. Plants with heads solitary; disk-fls. greenish-yellow, elongated and ovoid or conic.....4. HELIANTHUS TRIBE
(*Spilanthes*)
- DD. Lvs. alternate or basal.
- E. Inner involucre bracts enlarged and petal-like, white or colored; anthers tailed at base.
- F. Pappus of long-acuminate scales; receptacle chaffy.....12. CYNARA TRIBE
- FF. Pappus consisting of bristles or of short scales; receptacle naked or sometimes chaffy.....10. INULA TRIBE
- EE. Inner involucre bracts not enlarged nor petal-like.
- F. Tips and margins of lvs. or of involucre bracts spinose.....12. CYNARA TRIBE
- FF. Tips and margins of lvs. or of involucre bracts not spinose.
- G. Plants with lobed or dissected lvs.
- H. Receptacle bristly; involucre ovoid or globose.....12. CYNARA TRIBE
- HH. Receptacle never bristly; involucre neither ovoid nor globose.
- I. Involucre bracts imbricated, wholly or partly dry and scarious.....3. ANTHEMIS TRIBE
- II. Involucre bracts not as above.....9. SENECIO TRIBE
- GG. Plants with lvs. not lobed nor dissected.
- H. Fl.-heads in dense clusters surrounded by a whorl of woolly floral lvs.; anthers tailed at base.....10. INULA TRIBE
(*Leontopodium*)
- HH. Fl.-heads not as above; anthers not tailed at base.
- I. Lf. linear, not fleshy: disk-fls. yellow.....5. ASTER TRIBE
- II. Lf. broader or fleshy.
- J. Involucre bracts imbricated; fls. never yellow.....11. EUPATORIUM TRIBE
- JJ. Involucre bracts not imbricated: fls. sometimes yellow.....9. SENECIO TRIBE

2. KEY TO THE GENERA (sequence from Key 1).

1. CICHORIUM TRIBE. Herbs (seldom shrubs or trees) with milky juice: fls. all bisexual, with ligulate corolla 5-toothed; anthers sagittate-eared, not tailed at base; style-branches filiform, not appendaged.
- A. Fls. purple, blue or white (in ours).....1. CICHORIUM
- B. Heads sessile.....1. CICHORIUM
- BB. Heads long-peduncled.
- C. Bracts of involucre in many series.....2. CATANACHE
- CC. Bracts of involucre in 1 series.....3. TRAGOPOGON
- AA. Fls. yellow or red (in ours).
- B. Plant thistle-like, with spiny-toothed lvs.: heads sessile.....4. SCOLYMUS
- BB. Plant not thistle-like: heads peduncled.
- C. Pappus-bristles plumose.....5. SCORZONERA
- CC. Pappus-bristles simple.
- D. Foliage all basal.
- E. Lvs. mostly pinnatifid.....6. TARAXACUM
- EE. Lvs. not pinnatifid.....8. HIERACIUM
- DD. Foliage basal and cauline.
- E. Achenes flattened, beaked: grown for the edible lvs. or sts.....7. LACTUCA
- EE. Achenes cylindrical, usually not beaked: not edible.
- F. Lvs. in ours long-hairy: pappus-bristles rather rigid, usually dirty or neutral-colored.....8. HIERACIUM
- FF. Lvs. in ours nearly glabrous: pappus-bristles usually soft, white...9. CREPIS
2. MUTISIA TRIBE. Heads with or without rays; involucre bracts usually in many series, imbricated; fls. commonly with corollas bilabiate or deeply 5-cleft or the ray-fls. ligulate; anthers with long tails at base; style-branches not appendaged.10. GERBERA
3. ANTHEMIS TRIBE. Commonly strong-scented or bitter-aromatic: lvs. mostly alternate and more or less dissected: heads radiate or discoid; involucre bracts imbricated in 2 to many series, wholly or in part dry and scarious; disk-corollas regular, tubular; anthers not tailed at base; style-branches of the bisexual fls. commonly truncate.
- A. Rays usually present.
- B. Receptacle naked.
- C. Involucre bracts in many series: receptacle flat or convex.....11. CHRYSANTHEMUM
- CC. Involucre bracts in few series: receptacle conic or ovoid.....12. MATRICARIA
- BB. Receptacle with chaffy bracts.
- C. Heads solitary on long peduncles: achenes angled or only slightly compressed.....13. ANTHEMIS
- CC. Heads usually in dense clusters: achenes strongly compressed.....14. ACHILLEA

COMPOSITÆ

- AA. Rays lacking or inconspicuous.**
B. Heads in panicles or corymbs.
C. Pappus a short crown: heads in corymbs.
D. Receptacle naked.
E. Lvs. pinnately divided 15. **TANACETUM**
E. Lvs. simple 11. **CHRYSANthemum**
DD. Receptacle with chaffy bracts 16. **LONAS**
CC. Pappus none: heads in panicles 17. **ARTEMISIA**
BB. Heads solitary on long peduncles.
C. Plant a subshrub: receptacle with chaffy bracts 18. **SANTOLINA**
CC. Plant a small herb: receptacle without chaffy bracts 19. **COTULA**
- 4. HELIANTHUS TRIBE. Lvs. commonly opposite (at least the lower ones): heads mostly radiate; involucre bracts usually herbaceous, in 1 to many series; receptacle (in ours) with chaffy bracts subtending at least the outer disk-fls.; anthers not tailed at base; style-branches truncate or appendaged: pappus never of capillary bristles.**
A. Plants (ours) with all or some of the lvs. alternate.
B. Bracts of involucre enfolding the ray-achenes: plant glandular-viscid 20. **LATIA**
BB. Bracts of involucre not enfolding the ray-achenes: not glandular or viscid.
C. Ray-fls. short and inconspicuous, head appearing discoid 21. **PARTHENIUM**
CC. Ray-fls. conspicuous.
D. Disk hemispheric or globose to columnar.
E. Rays rose-purple or rose 22. **ECHINACEA**
EE. Rays yellow or white.
F. Achenes 4-angled, wingless 23. **RUDECKIA**
FF. Achenes flattened, margined or winged 24. **RATIBIDA**
DD. Disk flat or convex.
E. Involucral bracts in 2 distinct series, the outer narrower than inner 37. **COREOPSIS**
EE. Involucral bracts imbricated in several series, nearly equal.
F. Achenes winged, strongly flattened: disk-fls. sterile 25. **SILPHIUM**
FF. Achenes angled, slightly flattened: disk-fls. fertile.
G. Peduncle fistulose and enlarged below head: pappus persistent 26. **TITHONIA**
GG. Peduncle not fistulose or enlarged: pappus soon deciduous 27. **HELIANTHUS**
- AA. Plants with opposite lvs.**
B. Heads (in ours) without rays 28. **SPILANTHES**
BB. Heads with rays.
C. Pappus of 2-4 retrorsely barbed awns.
D. Achenes not beaked: rays yellow, white or none 29. **BIDENS**
DD. Achenes beaked: rays commonly not yellow 30. **COSMOS**
CC. Pappus of scales, teeth or awns, but awns not retrorsely barbed.
D. Roots tuberous.
E. Lvs. pinnate 31. **DAHLIA**
EE. Lvs. simple 27. **HELIANTHUS**
DD. Roots not tuberous.
E. Disk-fls. sterile.
F. Achenes winged: ray-fls. in 2-3 series 25. **SILPHIUM**
FF. Achenes not winged: ray-fls. in 1 series 32. **CHRYSOGONUM**
EE. Disk-fls. fertile.
F. Ray-fls. persisting on the achene and falling with it.
G. Margins of lvs. coarsely toothed: plant per. 33. **HELIOPSIS**
GG. Margins of lvs. entire: plant ann. (ours).
H. Lvs. sessile 34. **ZINNIA**
HH. Lvs. petioled 35. **SANTIVITALIA**
FF. Ray-fls. withering and falling before the achenes.
G. Bracts of involucre in more than 2 series 27. **HELIANTHUS**
GG. Bracts of involucre in 2 series.
H. Inner involucre bracts connate to or above the middle 36. **THELESERMA**
HH. Inner involucre bracts connate at base 37. **COREOPSIS**
- 5. ASTER TRIBE. Lvs. alternate or rarely opposite: heads radiate or discoid; involucre bracts usually unequal and in many series; receptacle seldom chaffy; disk-fls. chiefly yellow; anthers not tailed at base; style-branches of the bisexual fls. flattened, appendaged: pappus various, or none.**
A. Heads of disk-fls. only: plant (ours) a tall shrub 38. **BACCHARIS**
AA. Heads of both disk- and ray-fls.: plant herbaceous.
B. Size of heads 2-5 in. across (1-1½ in. in the pompon vars.); outer involucre bracts commonly leafy, longer than the others and reflexed 39. **CALLISTEPHUS**
BB. Size of heads smaller; outer involucre bracts not leafy nor reflexed.
C. Foliage (in ours) all basal.
D. Pappus none: heads 1-2 in. across 40. **BELLIS**
DD. Pappus of bristles and scales: heads ½ in. or less across 41. **BELLIUM**
CC. Foliage cauline as well as basal.
D. Rays yellow.
E. Infl. of few-fld. small heads, in ours forming large panicles or dense racemes 42. **SOLIDAGO**
EE. Infl. of many-fld. heads usually 1 in. or more across, solitary or in loose corymbs.
F. Fl.-heads several in corymbs 43. **CHRYSOOPSIS**
FF. Fl.-heads solitary or sometimes 2.
G. Pappus rigid: plant an ann. 1-4 ft. high 44. **XANTHISMA**
GG. Pappus fragile: plant (ours) a per. 1 ft. or less high 50. **ERIGERON**

COMPOSITÆ

- DD. Rays blue, purple, rose or white.
 E. Lvs. pinnately divided into narrow segms.
 F. Pappus of short scale-like bristles or wanting: bracts of involucre with scarious margins. 45. BRACHYCOME
 FF. Pappus of conspicuous bristles: bracts of involucre not scarious-margined. 51. ASTER
 EE. Lvs. (at least the upper) entire or only toothed.
 F. Plant an evergreen shrub with lvs. white-tomentose beneath. 46. OLEARIA
 FF. Plant an herb or if shrubby lvs. not as above.
 G. Bristles of pappus plumose. 47. CHARIEIS
 GG. Bristles of pappus, when present, not plumose.
 H. Pappus not uniform in all fs.
 I. Bracts of involucre in few series: pappus of scales with few stiff bristles. 48. BOLTONIA
 II. Bracts of involucre in many series: pappus of short and long chaffy bristles. 49. HETEROPAPPUS
 HH. Pappus of uniform bristles.
 I. Involucral bracts in 1-2 series: rays in 2 or more series. 50. ERIGERON
 II. Involucral bracts in 2 to many series: rays in 1-2 series.
 J. Bracts of involucre without scarious margins. 51. ASTER
 JJ. Bracts of involucre with scarious margins.
 K. Color of rays purple or lilac (in ours): lvs. incised-dentate. 52. CALIMERIS
 KK. Color of rays bright blue: lvs. entire or denticulate. 53. FELICIA
6. ARCTOTIS TRIBE. Lvs. mostly alternate or basal: heads commonly radiate; involucral bracts imbricated in several rows, separate or united at base; fs. of the disk tubular and regular; anthers not tailed at base; style-branches not appendaged.
 A. Herbage tomentose: receptacle naked or bristly.
 B. Involucral bracts separate from each other.
 C. Achenes usually villous, crowned by hyaline, often convolute scales. 54. ARCTOTIS
 CC. Achenes glabrous, with or without crown of minute scales. 55. VENIDIUM
 BB. Involucral bracts grown together at base. 56. GAZANIA
 AA. Herbage glabrous or pubescent: involucral bracts not grown together; receptacle chaffy. 57. URSINIA
7. HELENIUM TRIBE. Lvs. not rarely glandular-punctate or glandular- or resinous-dotted: heads radiate or rarely discoid; involucral bracts in 1 to several series; receptacle naked; fs. commonly yellow; anthers not tailed at base; style-branches truncate or appendaged.
 A. Involucral bracts united nearly throughout: herbage glabrous. 58. TAGETES
 AA. Involucral bracts separate or united only at base: herbage seldom glabrous.
 B. Plant white-woolly (in ours).
 C. Rays persistent on achene and becoming papery. 59. BAILEYA
 CC. Rays deciduous. 60. ERIOPHYLLUM
 BB. Plant not white-woolly.
 C. Receptacle with small bristle-like fringe among the fs.: base of lf. not decurrent on st. 61. GAILLARDIA
 CC. Receptacle not as above: base of lf. often decurrent on st.
 D. Bracts of involucre erect: low herbs, ours with basal lvs. 62. ACTINEA
 DD. Bracts of involucre spreading or reflexed: tall leafy-stemmed herbs. 63. HELENIUM
8. CALENDULA TRIBE. Herbs or shrubs: lvs. commonly alternate: heads radiate; involucral bracts subequal, in 1-3 series, often with dry-scarious border; receptacle naked, or very seldom with a few bristles; disk-fs. regular, tubular, 5-toothed, mostly infertile; ray-fs. pistillate and fertile, commonly ligulate; anthers with base sagittate or sometimes eared or tailed; style-branches bifid or entire: achenes usually large; pappus commonly none, sometimes of a few deciduous hairs.
 A. Disk-fs. fertile.
 B. Ray-fs. fertile; style divided into 2 branches. 64. DIMORPHOTHECA
 BB. Ray-fs. sterile; style none or undivided. 65. CASTALIS
 AA. Disk-fs. sterile.
 B. Achenes straight. 66. OSTEOSPERMUM
 BB. Achenes, at least the inner ones, incurved. 67. CALENDULA
9. SENECIO TRIBE. Lvs. mostly alternate or basal: heads commonly radiate; involucral bracts mostly equal and in 1 or 2 series, with or without short accessory bracts at base; receptacle naked; anthers not tailed at base; style-branches truncate or obtuse, with or without appendages.
 A. Bracts of involucre united one-third or one-half their length: pappus none. 68. GAMOLEPIS
 AA. Bracts of involucre distinct or united only at base: pappus of bristles.
 B. Ray-fs. lacking.
 C. Habit (in ours) climbing. 76. SENECIO
 CC. Habit not climbing.
 D. Plant densely pubescent, the st. with violet or purple hairs. 69. GYNURA
 DD. Plant glabrous or only slightly pubescent.
 E. Lvs. clasping at base, flat: plant not succulent. 70. EMILIA
 EE. Lvs. not clasping, often cylindrical: plant succulent. 71. KLEINIA
 BB. Ray-fs. present.
 C. Disk-fs. sterile; style undivided: lvs. (in ours) fleshy and cylindrical. 72. OTHONNA
 CC. Disk-fs. fertile; style branched: lvs. not fleshy and cylindrical.
 D. St.-lvs. opposite. 73. ARNICA

COMPOSITÆ

- DD. St.-lvs. alternate.
 E. Involucral bracts in 2-3 nearly equal series.74. **DORONICUM**
 EE. Involucral bracts in 1 series, often with short bracts at base.
 F. Margins of involucral bracts overlapping.75. **LIGULARIA**
 FF. Margins of involucral bracts not overlapping.76. **SENECIO**
10. **INULA TRIBE.** Often woolly; lvs. commonly alternate or basal, entire or nearly so; heads radiate or discoid; involucral bracts commonly dry and scarious and in several series, sometimes foliaceous or petaloid; receptacle naked or scaly; anthers tailed at base.
 A. Heads surrounded by a whorl of white-woolly floral lvs.77. **LEONTOPODIUM**
 AA. Heads not surrounded by a whorl of floral lvs.
 B. Involucral bracts not white or colored and petal-like: heads with both ray- and disk-fls., the rays yellow.
 C. Pappus of bristles: receptacle not chaffy.78. **INULA**
 CC. Pappus of scales united into a crown: receptacle chaffy.79. **BUPHTHALMUM**
 BB. Involucral bracts commonly white or colored and petal-like: heads with disk-fls. only.
 C. St. and branches (in ours) conspicuously winged: pappus crown- or cup-shaped.80. **AMMOBIUM**
 CC. St. and branches not winged: pappus bristly.
 D. Herbage not white-woolly.
 E. Pappus-bristles plumose throughout.81. **HELIPTERUM**
 EE. Pappus-bristles plumose only at tip.82. **HELICHRYSUM**
 DD. Herbage white-woolly.
 E. Plant stoloniferous or trailing (in ours).
 F. Fl.-heads (in ours) solitary.82. **HELICHRYSUM**
 FF. Fl.-heads clustered.83. **ANTENNARIA**
 EE. Plant not stoloniferous or trailing.
 F. Pappus-bristles plumose.81. **HELIPTERUM**
 FF. Pappus-bristles not plumose or only so at tip.
 G. Lvs. ovate (in ours): branches vine-like.82. **HELICHRYSUM**
 GG. Lvs. linear-lanceolate: branches erect.84. **ANAPHALIS**
11. **EUPATORIUM TRIBE.** Lvs. simple: heads discoid; involucral bracts imbricate in several series or in 1-2 series and only slightly unequal; corollas tubular, regular, never pure yellow; anthers not tailed at base; style-branches commonly elongate, more or less thickened above; pappus commonly setose.
 A. Habit climbing: involucre of 4 bracts.85. **MIKANIA**
 AA. Habit not climbing: involucre of more than 4 bracts.
 B. Heads in spikes or racemes: achenes 10-ribbed.86. **LIATRIS**
 BB. Heads in clusters or corymbs, often paniced: achenes 4-5-angled.
 C. Pappus of capillary bristles.87. **EUPATORIUM**
 CC. Pappus none or of scales.
 D. Anthers appendaged at apex: heads many-fld.88. **AGERATUM**
 DD. Anthers truncate at apex, not appendaged: heads 3-5-fld.89. **PIQUERIA**
12. **CYNARA TRIBE.** Lvs. alternate, often spinose-toothed or -lobed: involucral bracts imbricated in many series, often spinose or scarious or foliaceous at tip; fls. bisexual, the corollas tubular with 5 long narrow lobes, or the marginal enlarged ray-like and usually neutral; anthers tailed at base; style-branches short, distinct or united.
 A. Plants not thistle-like or spiny.
 B. Lvs. roundish and mostly cordate: involucral bracts with hooked tips.90. **ARCTIUM**
 BB. Lvs. elongate, not cordate, sometimes pinnatifid: involucral bracts usually without hooked tips.
 C. Inner bracts of involucre petal-like.91. **XERANTHEMUM**
 CC. Inner bracts of involucre not petal-like.92. **CENTAUREA**
 AA. Plant thistle-like, often spiny.
 B. Pappus of scales or none.
 C. Fls. (in ours) orange-yellow: lvs. green and glabrous.93. **CARTHAMUS**
 CC. Fls. blue or white: lvs. white-tomentose beneath.94. **ECHINOPS**
 BB. Pappus of bristles.
 C. Fls. yellow.95. **CNICUS**
 CC. Fls. purple to white.
 D. Achenes hairy: plant stemless (in ours).96. **CARLINA**
 DD. Achenes not hairy: plant with sts.
 E. Sts. winged by the decurrent lf.-bases: receptacle not bristly.97. **ONOPORDUM**
 EE. Sts. seldom winged by the decurrent lf.-bases: receptacle bristly.
 F. Lvs. glabrous, white-spotted above.98. **SILYBUM**
 FF. Lvs. tomentose beneath, not white-spotted above.99. **CYNARA**
13. **VERNONIA TRIBE.** Lvs. commonly alternate and simple: heads discoid; fls. never yellow; involucral bracts imbricated in several series or rarely few in 1-2 series; corollas tubular and regular except in *Stokesia* which has its outer corollas enlarged and with palmately cleft limb simulating a ligule; anthers not tailed at base; style-branches slender, filiform or attenuate.
 A. Outer row of disk-fls. resembling inner ones, not enlarged or slit; heads (in ours) $\frac{1}{2}$ in. across.100. **VERNONIA**
 AA. Outer row of disk-fls. slit down one side, enlarged and ray-like; heads 3-4 in. across.101. **STOKESIA**

COMPOSITÆ

3. ARTIFICIAL KEY TO GENERA AND SPECIES HEREIN TREATED.

- A. Plant thistle-like, usually lvs. and involucre bracts spiny.
- B. Heads of ligulate or ray-fls. only 4. SCOLYMUS
- BB. Heads of tubular or disk-fls. only.
- C. Pappus of scales or none.
- D. Fls. (in ours) orange-yellow: lvs. green and glabrous 93. CARTHAMUS
- DD. Fls. blue or white: lvs. white-tomentose beneath 94. ECHINOPS
- CC. Pappus of bristles.
- D. Fls. yellow 95. CNICUS
- DD. Fls. purple to white.
- E. Achenes hairy: plant stemless (in ours) 96. CARLINA
- EE. Achenes not hairy: plant with sts.
- F. Sts. winged by the decurrent lf.-bases: receptacle not bristly 97. ONOPORDUM
- FF. Sts. seldom winged by decurrent lf.-bases: receptacle bristly.
- G. Lvs. glabrous, white-spotted above 98. SILYBUM
- GG. Lvs. tomentose beneath, not white-spotted above 99. CYNARA
- AA. Plant not thistle-like.
- B. Pappus (at least one series) of bristles or bristle-like hairs (not widened at base).
- C. Ray- or ligulate fls. lacking.
- D. Lvs. opposite or whorled.
- E. Habit climbing: involucre of 4 bracts 85. MIKANIA
- EE. Habit not climbing: involucre of more than 4 bracts 87. EUPATORIUM
- DD. Lvs. alternate or basal.
- E. Heads surrounded by a whorl of white-woolly floral lvs. 77. LEONTOPODIUM
- EE. Heads not surrounded by whorl of floral lvs.
- F. Habit (in ours) climbing 76. SENECIO
- FF. Habit not climbing.
- G. Inner involucre bracts white or colored, often petal-like (known as "Everlastings").
- H. Bristles of pappus plumose throughout 81. HELIPTERUM
- HH. Bristles of pappus simple or plumose only at tip.
- I. Height of plant mostly 1 ft. or less, stoloniferous or trailing.
- J. Fl.-heads solitary (in ours) 82. HELICHRYSUM
- JJ. Fl.-heads clustered 83. ANTENNARIA
- II. Height of plant 1-3 ft., not stoloniferous.
- J. Shape of lvs. linear-lanceolate 84. ANAPHALIS
- JJ. Shape of lvs. oblong to ovate 82. HELICHRYSUM
- GG. Inner involucre bracts green, not petal-like.
- H. Fl.-heads in narrow spikes or racemes 86. LIATRIS
- HH. Fl.-heads in clusters, panicles or solitary.
- I. Involucre bracts imbricated in several series.
- J. Receptacle densely bristly: involucre bracts usually with fringed or spine-tipped appendages 92. CENTAUREA
- JJ. Receptacle naked: involucre bracts not as above.
- K. Color of heads white or yellowish: plant a shrub 38. BACCHARIS
- KK. Color of heads deep purple: plant an herb 100. VERNONIA
- II. Involucre bracts in 1 series, sometimes with spreading bracts at base.
- J. Pubescence dense, the st. with violet or purple hairs 69. GYNURA
- JJ. Pubescence slight or none.
- K. Base of lvs. clasping: plant not succulent 70. EMILIA
- KK. Base of lvs. not clasping: plant succulent 71. KLEINIA
- CC. Ray- or ligulate fls. present.
- D. Heads of ligulate fls. only.
- E. Bristles of pappus plumose.
- F. Bracts of involucre in 1 row 3. TRAGOPOGON
- FF. Bracts of involucre in several series 5. SCORZONERA
- EE. Bristles of pappus not plumose.
- F. Infl. a panicle 7. LACTUCA
- FF. Infl. a long-peduncled cluster or fls. solitary.
- G. Foliage all basal.
- H. Lvs., at least some of them, pinnatifid 6. TARAXACUM
- HH. Lvs. not pinnatifid 8. HIERACIUM
- GG. Foliage cauline as well as basal.
- H. Fl.-heads usually 2-5 in. across: basal tuft of lvs. lacking 39. CALLISTEPHUS
- HH. Fl.-heads $\frac{1}{2}$ -2 in. across: basal lvs. forming tuft.
- I. Lvs. long-hairy (in ours): pappus neutral-colored and stiff 8. HIERACIUM
- II. Lvs. nearly glabrous (in ours): pappus white and soft 9. CREPIS
- DD. Heads of both ray- and disk-fls.
- E. Color of heads yellow or orange.
- F. Fl.-heads in corymbs, panicles or racemes.
- G. Pappus in 2 series, the outer of scales or smaller bristles 43. CHRYSOPSIS
- GG. Pappus of equal bristles.
- H. Involucre bracts unequal, imbricated in several series.
- I. Size of heads $\frac{1}{2}$ in. or less 42. SOLIDAGO
- II. Size of heads 1 in. or more 78. INULA
- HH. Involucre bracts nearly equal, in 1-3 series, sometimes with calyx-like bracts at base.

COMPOSITÆ

- i. St.-lvs. clasping: bracts of involucre in 2-3 series, without short bracts at base.74. **DORONICUM**
- ii. St.-lvs. not clasping: bracts of involucre in 1 series, often with short bracts at base.
 - J. Margins of involucre bracts overlapping.75. **LIGULARIA**
 - JJ. Margins of involucre bracts not overlapping.76. **SENECIO**
- FF. Fl.-heads solitary.
 - g. Sts. trailing or drooping: lvs. succulent.72. **OTHONNA**
 - gg. Sts. upright: lvs. not succulent.
 - h. Corolla of disk-fls. bilabiate.10. **GERBERA**
 - hh. Corolla of disk-fls. not bilabiate.
 - i. Bracts of involucre enfolding the ray-achenes.20. **LAYIA**
 - ii. Bracts of involucre not enfolding the ray-achenes.
 - J. Involucral bracts nearly equal, in 1-3 series.
 - k. St.-lvs. opposite.73. **ARNICA**
 - kk. St.-lvs. alternate.
 - L. Height of plant less than 1 ft.: heads 1 in. across.50. **ERIGERON**
 - LL. Height of plant 1-5 ft.: heads 1½-4 in. across.74. **DORONICUM**
 - JJ. Involucral bracts unequal, imbricated in several series.
 - k. Receptacle densely bristly.92. **CENTAUREA**
 - kk. Receptacle not bristly.
 - L. Margins of involucre bracts whitish: plant ann.44. **XANTHISMA**
 - LL. Margins of involucre bracts not whitish: plant per.78. **INULA**
 - EE. Color of heads pink, purple or white, never yellow.
 - F. Bristles of pappus plumose.47. **CHARIEIS**
 - FF. Bristles of pappus not plumose.
 - g. Corolla of disk-fls. bilabiate.10. **GERBERA**
 - gg. Corolla of disk-fls. not bilabiate.
 - h. Fl.-heads in corymbs or panicles.
 - i. An evergreen shrub with lvs. white-tomentose beneath.46. **OLEARIA**
 - ii. An herb, or if shrubby lvs. not as above.
 - J. Pappus not uniform in all fls.
 - k. Rays blue; margins of involucre bracts not scarious.49. **HETEROPAPPUS**
 - kk. Rays white to purple; margins of involucre bracts scarious.48. **BOLTONIA**
 - JJ. Pappus uniform in all fls.
 - k. Bracts of involucre imbricated in 2 to many series.51. **ASTER**
 - kk. Bracts of involucre in 1-2 series.
 - L. Involucre of 1-2 series of nearly equal bracts.50. **ERIGERON**
 - LL. Involucre of 1 series of equal bracts, subtended by small bracts resembling a calyx.76. **SENECIO**
 - HH. Fl.-heads solitary.
 - i. Foliage all basal.41. **BELLIUM**
 - ii. Foliage cauline as well as basal.
 - J. Receptacle densely bristly; involucre bracts usually with fringed or spine-tipped appendages.92. **CENTAUREA**
 - JJ. Receptacle not bristly; involucre bracts not as above.
 - k. Outer involucre bracts commonly leafy, longer than others and reflexed: heads usually 2-5 in. across.39. **CALLISTEPHUS**
 - kk. Outer involucre bracts not leafy or reflexed: heads smaller.
 - L. Rays in 2 or more series; involucre bracts in 1-2 series.50. **ERIGERON**
 - LL. Rays in 1-2 series; involucre bracts in 2 to many series.
 - M. Bracts of involucre without scarious margins.51. **ASTER**
 - MM. Bracts of involucre with scarious margins.
 - N. Lvs. incised-dentate: rays purple or lilac.52. **CALIMERIS**
 - NN. Lvs. entire or denticulate: rays bright blue.53. **FELICIA**
 - BB. Pappus of scales or awns, or lacking.
 - c. Bracts of involucre papery, white or colored and ray-like (known as "Everlastings").
 - d. Branches conspicuously winged: bracts white.80. **AMMOBIUM**
 - dd. Branches not winged: bracts purple or rose.91. **XERANTHEMUM**
 - cc. Bracts of involucre not papery and ray-like.
 - D. Rays lacking or inconspicuous.
 - E. Fl.-heads solitary.
 - F. Lvs. opposite.28. **SPILANTHES**
 - FF. Lvs. alternate.
 - g. Receptacle densely bristly: involucre bracts commonly with fringed or spine-tipped appendages.92. **CENTAUREA**
 - gg. Receptacle not bristly; involucre bracts not as above.
 - H. A creeping herb: receptacle without chaffy bracts.19. **COTULA**
 - HH. A subshrub 1-2 ft. high: receptacle with chaffy bracts.18. **SANTOLINA**
 - EE. Fl.-heads in clusters, corymbs or panicles.
 - F. Lf. pinnately or palmately divided.
 - g. Heads in corymbs: pappus a short crown.
 - H. Receptacle naked.15. **TANACETUM**
 - HH. Receptacle with chaffy bracts.16. **LONAS**
 - gg. Heads in panicles or racemes: pappus none.17. **ARTEMISIA**
 - FF. Lf. simple.

COMPOSITÆ

- g. Involucral bracts with hooked tips, the head becoming a bur. 90. ARCTIUM
 gg. Involucral bracts not hooked, head not bur-like.
 h. Lvs. opposite.
 i. Heads few-fl'd.: lvs. oblong-lanceolate. 89. PIQUERIA
 ii. Heads many-fl'd. and dense: lvs. ovate. 88. AGERATUM
 hh. Lvs. alternate.
 i. Heads in racemes forming a panicle: pappus none. 17. ARTEMISIA
 ii. Heads in a long-peduncled corymb: pappus a crown or of scales or awns.
 j. Herbage silvery-pubescent. 21. PARTHENIUM
 jj. Herbage green. 11. CHRYSANTHEMUM
 dd. Rays present and conspicuous.
 e. Outer involucral bracts united to form a cup or tube.
 f. Lvs. white-tomentose beneath, mostly basal. 56. GAZANIA
 ff. Lvs. glabrous, not basal.
 g. Pappus lacking: lvs. alternate. 68. GAMOLEPIS
 gg. Pappus of scales: lvs. opposite. 58. TAGETES
 ee. Outer involucral bracts free or united only at base.
 f. St.-lvs. lacking, heads on naked scapes.
 g. Heads of ligulate fls. only. 2. CATANANCHE
 gg. Heads of both ray- and disk-fls.
 h. Ray-fls. white, rose or blue, never yellow.
 i. Diam. of heads 1-2 in.: pappus none. 40. BELLIS
 ii. Diam. of heads to $\frac{1}{2}$ in.: pappus present. 41. BELLUM
 hh. Ray-fls. yellow.
 i. Lvs. entire. 62. ACTINEA
 ii. Lvs. pinnatifid or lyrate.
 j. Whole plant white-woolly: involucral bracts nearly equal and erect. 59. BAILEYA
 jj. Whole plant not white-woolly, only lvs. underneath: outer involucral bracts smaller and reflexed or spreading. 54. ARCTOTIS
 ff. St.-lvs. present.
 g. Lvs. opposite.
 h. Lf. compound.
 i. Awns of pappus retrorsely barbed.
 j. Achenes beaked. 30. COSMOS
 jj. Achenes not beaked. 29. BIDENS
 ii. Awns of pappus not retrorsely barbed.
 j. Roots tuberous. 31. DAHLIA
 jj. Roots not tuberous.
 k. Herbage rough-hispid: involucral bracts in several nearly equal series. 25. SILPHIUM
 kk. Herbage not rough: involucral bracts in 2 unequal series.
 l. Inner involucral bracts connate to or above the middle. 36. THELESPERMA
 ll. Inner involucral bracts connate only at base. 37. COREOPSIS
 hh. Lf. simple.
 i. Awns of pappus retrorsely barbed. 30. COSMOS
 ii. Awns of pappus not retrorsely barbed.
 j. Disk-fls. sterile.
 k. Achenes winged: ray-fls. in 2-3 series. 25. SILPHIUM
 kk. Achenes not winged: ray-fls. in 1 series. 32. CHRYSOGONUM
 jj. Disk-fls. fertile.
 k. Ray-fls. withering and falling before the achenes.
 l. Involucral bracts in 2 series, the inner connate at base. 37. COREOPSIS
 ll. Involucral bracts in more than 2 series, the inner not connate. 27. HELIANTHUS
 kk. Ray-fls. persisting on the achene and falling with it.
 l. Margins of lvs. coarsely toothed. 33. HELIOPSIS
 ll. Margins of lvs. entire.
 m. Base of lf. sessile. 34. ZINNIA
 mm. Base of lf. petioled. 35. SANVITALIA
 gg. Lvs. alternate.
 h. Color of rays blue, purple, red or white, but not yellow.
 i. Heads sessile along the branches. 1. CICHORIUM
 ii. Heads not as above.
 j. Involucral bracts herbaceous, not dry and scarious.
 k. Disk flat.
 l. Receptacle bristly. 92. CENTAUREA
 ll. Receptacle naked. 101. STOKESIA
 kk. Disk convex to globose or conical.
 l. Receptacle naked. 63. HELENIUM
 ll. Receptacle with bristles or chaffy bracts.
 m. Apex of rays shallowly 2-toothed. 22. ECHINACEA
 mm. Apex of rays deeply 3-toothed or parted. 61. GAILLARDIA
 jj. Involucral bracts with dry and scarious margins or tips.
 k. Heads of ligulate fls. only.
 l. Receptacle bristly: lvs. simple. 2. CATANANCHE
 ll. Receptacle naked: lvs. divided. 11. CHRYSANTHEMUM

- KK.** Heads of both ligulate and disk-fls.
L. Lf. simple, although sometimes lobed.
M. Base of achenes with tuft of silky hairs.....54. *ARCTOTIS*
MM. Base of achenes without tuft of hairs.
N. Pappus of conspicuous scales and bristles...48. *BOLTONIA*
NN. Pappus a cup-like rim or lacking.
O. Achenes of disk-fls. broadly winged: involucre bracts in 1-2 series.
P. Ray-fls. fertile; style divided into 2 branches.
Q. Disk-fls. fertile: ours an ann. to 16 in. high.....64. *DIMORPHOTHECA*
QQ. Disk-fls. sterile: ours a shrubby per. 2 ft. or more high.....66. *OSTEOSPERMUM*
PP. Ray-fls. sterile; style none or undivided...65. *CASTALIS*
OO. Achenes not winged: involucre bracts in several to many series.
P. Receptacle naked.....11. *CHRYSANTHEMUM*
PP. Receptacle with chaffy bracts.....14. *ACHILLEA*
LL. Lf. compound.
M. Receptacle with chaffy bracts.
N. Achenes strongly compressed: heads usually small and in dense clusters.....14. *ACHILLEA*
NN. Achenes angled or only slightly compressed: heads solitary on long peduncles.....13. *ANTHEMIS*
MM. Receptacle naked.
N. Fl.-heads with blue rays.....45. *BRACHYCOME*
NN. Fl.-heads with white, pink or purple rays.
O. Disk flat or convex; involucre bracts in many series.....11. *CHRYSANTHEMUM*
OO. Disk conical or ovoid; involucre bracts in few series.....12. *MATRICARIA*
HH. Color of rays yellow, sometimes with red or purple at base.
I. Margins or tips of involucre bracts, at least the inner ones, dry and scarious.
J. Involucre bracts in 1-2 series.
K. Achenes of ray-fls. straight: lvs. toothed or lobed...64. *DIMORPHOTHECA*
KK. Achenes of ray-fls. incurved: lvs. entire or only slightly toothed.....67. *CALENDULA*
JJ. Involucre bracts imbricated in several to many series.
K. Scales of pappus enlarged and white on mature achene.....57. *URSIDIA*
KK. Scales not as above, or lacking.
L. Receptacle honeycombed.....55. *VENIDIUM*
LL. Receptacle not honeycombed.
M. Chaffy scales lacking on receptacle.....11. *CHRYSANTHEMUM*
MM. Chaffy scales present on receptacle.
N. Lf. pinnately compound.
O. Achenes strongly compressed: heads usually small and in dense clusters.....14. *ACHILLEA*
OO. Achenes angled or only slightly compressed: heads solitary on long peduncles...13. *ANTHEMIS*
NN. Lf. simple.
O. Heads $\frac{1}{4}$ in. or less across.....14. *ACHILLEA*
OO. Heads 1-2 $\frac{1}{2}$ in. across.....79. *BUPHTHALMUM*
II. Margins or tips of involucre bracts herbaceous, not dry and scarious.
J. Disk hemispheric or globose to columnar.
K. Receptacle naked.....63. *HELENIUM*
KK. Receptacle with chaffy bracts or bristles.
L. Apex of rays deeply 3-toothed or -parted.....61. *GAILLARDIA*
LL. Apex of rays shallowly toothed or entire.
M. Achenes 4-angled, wingless.....23. *RUDBECKIA*
MM. Achenes flattened, margined or winged.....24. *RATIBIDA*
JJ. Disk flat.
K. Receptacle naked.
L. Ray-fls. persistent on achene and becoming papery...59. *BAILEYA*
LL. Ray-fls. deciduous.....60. *ERIOPHYLLUM*
KK. Receptacle with bristles or chaffy bracts.
L. The receptacle densely bristly.....92. *CENTAUREA*
LL. The receptacle with chaffy bracts.
M. Peduncle fistulose and enlarged below the head...26. *TITHONIA*
MM. Peduncle not as above.
N. Achenes winged, strongly flattened: disk-fls. sterile.....25. *SILPHIUM*
NN. Achenes angled, slightly flattened: disk-fls. fertile.....27. *HELIANTHUS*

1. *CICHORIUM*, L. Species about 9, mostly in the Medit. region and to Abyssinia, two yielding food products.—Per., bien. or ann. herbs, branching and diffuse

when in bloom, mostly with deep hard roots: lvs. alternate, usually towards base of plant: heads mostly axillary and sessile, some terminal; involucre bracts in 2 series, at least the apical one-half herbaceous; fls. all ligulate, blue, purple or white, several to many in a head; rays truncate, 5-toothed at apex: achenes long-beaked, crowned by a pappus of blunt paleæ or scales. (Cichorium: from an old Arabic name.)

A. Bracts subtending heads commonly shorter than heads: fls. blue, white or pink. 1. *C. Intybus*
 AA. Bracts subtending heads leafy, commonly longer than heads: fls. purple. 2. *C. Endivia*

1. *C. Intybus*, L. CHICORY. SUCCORY. Stout deep-rooted per., 3-6 ft.; upper branches practically leafless: lvs. broadly oblong, oblanceolate or lanceolate, more or less clasping, the lower ones nearly entire to runcinate, the upper passing into bracts commonly shorter than the heads; lower lvs. bristly-hairy beneath, at least on midrib: fls. bright azure-blue, in heads $1\frac{1}{2}$ in. or more across, closing about noon: pappus about one-eighth to one-tenth as long as achene. (Intybus: Latin for chicory.) Eu.—Fls. in some races pink or white. Cult. for the root (substitute for coffee) and for the salad-lvs. (Witloof, Barbe).

2. *C. Endivia*, L. ENDIVIE. Ann. or bien., the branching leafy sts. 2-3 ft., glabrous: lvs. many at base, brittle, oblong, lobed or cut, the upper passing into leafy bracts commonly much exceeding the heads: fls. purple, in heads about $1\frac{1}{2}$ in. across: pappus about one-sixth to one-fourth as long as achene. (Endivia: probably derived from same root as Intybus.) Probably India.—Cult. as a salad plant.

2. **CATANANCHE**, L. CUPIDS-DART. About 5 species native to the Medit. region, one cult. for the showy bloom.—Ann. or per. herbs: lvs. linear or lanceolate, crowded toward the base of the st.: fls. all ligulate, blue or yellow, in long-peduncled heads; involucre bracts in many series, the apical two-thirds scarious; receptacle bristly: achenes oblong, usually villose or setose, crowned with bristles or lanceolate long-acuminate scales. (Catanché: Greek name, referring to ancient custom of using the plant in making love-philters.)

C. cærulea, L. Per. to 2 ft., but blooming first year from seed: lvs. tomentose, lanceolate or oblanceolate, 8-12 in. long, entire or few-toothed: fls. heads 2 in. across, on long slender peduncles, the wide flat-toothed rays blue: pappus of 5-8 aristate scales. S. Eu. Var. *alba*, Hort., has all white rays and var. *bicolor*, Hort., white rays blue at base.

3. **TRAGOPOGON**, L. GOATS-BEARD. About 45 species native to S. Eu., N. Afr. and Cent. and S. Asia, one cult. in the vegetable-garden.—Erect glabrous bien. or per. herbs with a tap-root and narrow grass-like lvs.: fls. all ligulate, purple or yellow, in large long-peduncled heads; rays 5-toothed at apex; involucre cylindric or nearly so, with approximately equal-length bracts in a single row; anthers sagittate; style-branches slender: pappus composed of plumose bristles in a single series. (Tragopogon: Greek for *goat's beard*.)

T. porrifolius, L. SALSIFY. VEGETABLE-OYSTER. OYSTER-PLANT. Strict bien. to 4 ft., with edible roots to 1 ft. long: lvs. keeled, tapering from a broad often clasping base: peduncle thickened and hollow beneath head: fls. purple, showy, opening in the morning and closing by noon, the outer rays exceeded by the involucre bracts; receptacle naked: achenes ("seeds") stick-like, long-beaked; pappus yellowish. S. Eu.; nat. in N. Amer.

4. **SCOLYMUS**, L. Erect thistle-like herbs, native of the Medit. region, one somewhat cult. for its edible tap-root; 3 or 4 species.—Lvs. alternate, pinnately spinose-toothed or -lobed, with bases decurrent in spinose wings: fls. all ligulate, yellow, in sessile heads; involucre bracts spinescent-tipped, in few rows; receptacle chaffy: achenes beakless; pappus a ring or few bristles. (Scolymus: old Greek name, used by Hesiod.)

S. hispanicus, L. GOLDEN THISTLE. SPANISH OYSTER-PLANT. Much-branched bien. 2-2½ ft. high, usually pubescent: basal lvs. spiny, oblong, pinnatifid, dark green with paler ribs and veins: heads few-fl., about 1 in. long: achenes chaff-like, wing-margined; pappus consisting of scarious unequal paleæ. S. Eu.

5. **SCORZONERA**, L. About 100 species of the Old World, one yielding a root-vegetable.—Per. herbs or rarely ann.: lvs. commonly entire and grass-like or wider, sometimes more or less pinnately lobed or dissected: fls. all ligulate, yellow, rose or lilac, in long-peduncled heads; involucre bracts in several series, the outer much

shorter than the inner: achenes many-ribbed, beakless; pappus-bristles plumose with soft hairs, often naked at tip. (Scorzone-ra: old French *scorzon*, serpent; *S. hispanica* was used against snake-bite.)

S. hispanica, L. **BLACK SALSIFY**. Much-branched per., woolly-pubescent to nearly glabrous, 2-3 ft., with a long fleshy tap-root like that of salsify, but having a black skin: lvs. oblong to lanceolate or in some forms linear, undulate, tapering below into a long winged petiole: fls. yellow, in long-peduncled heads to 2 in. long: achenes nearly white, many-ribbed, the ribs of the outer ones papillate. Cent. and S. Eu.—Cult. for its fleshy edible root and for its lvs. which are sometimes used for salads.

6. TARAXACUM, Haller. **DANDELION**. Per. herbs mostly of the northern hemisphere, by recent authorities separated into many species.—Lvs. basal, runcinate-pinnatifid or lyrate or sometimes nearly entire: fls. all ligulate, yellow, in many-fl. heads terminating a naked hollow scape; involucre bracts in 2 series, the inner erect and narrow, the outer smaller and spreading or reflexed; receptacle naked: achenes angled, fusiform, attenuated into a slender beak; pappus simple and capillary. (Tarax-acum: from a native Arabian name.)

A. Involucral bracts without appendages. 1. *T. officinale*
AA. Involucral bracts with horn-like appendages. 2. *T. kok-saghyz*

1. **T. officinale**, Weber (*Leontodon Taraxacum*, L.). **COMMON DANDELION**. Lvs. obovate-lanceolate to linear, to 10 in. long, sinuate-dentate or pinnatifid, rarely nearly entire: heads 1-2 in. across, on scapes to 1½ ft. high; outer involucre bracts narrower than inner, reflexed, without appendages: achenes greenish-brown, with copious white pappus. Eu. but widely nat.—Grown and collected for greens.

2. **T. kok-saghyz**, Rodin. Differs in lvs. not so deeply lobed, often nearly entire, smaller heads, involucre bracts not reflexed and with well-developed horn-like appendages. Turkestan.—One of the plants yielding rubber.

7. LACTUCA, L. Tall ann. and per. herbs, mostly of the northern hemisphere, about 100 species, many weedy, one widely cult. as a garden vegetable.—Lvs. alternate, variable, often pinnatifid: heads small, in long irregular panicles, the rays white, yellow, pink or blue; involucre cylindric, with several series of imbricated bracts of which the outermost are short; receptacle flat and naked; rays few or many, truncate but 5-toothed at the apex: achenes oval to linear, flat, plainly 3-5-ribbed on either side, the soft thin white or brown pappus elevated on a long or short beak. (Lactuca: from *lac*, Latin for milk, in allusion to the milky juice.)

L. sativa, L. **LETTUCE**. Ann. erect smooth herb grown for its crisp edible highly developed radical lvs. which appear before the fl.-stalk; sts. 3-4 ft., leafy, branching above: radical lvs. 5-10 in. long, thin, nearly orbicular, oblong, obovate or lingulate, plane, bullate or curled; st.-lvs. auriculate-clasping, apiculate-serrate: fl.-heads erect, 12-16-fl., with yellow rays, open in forenoon: achenes ("seeds") lenticular-oblong, broadest toward apex, straw-colored or black. Cultigen.—The plant known as **CELTUCE** belongs here; the sts. are edible until the fl.-buds appear, and the young lvs. may be used for salad. Var. **asparagina**, Bailey (*L. angustana*, Vilm. not All. *L. sativa* var. *angustana*, Irish), **ASPARAGUS LETTUCE**, grown for its thick edible st., not forming a head; lower lvs. narrow-lanceolate and long-attenuate, 8-12 in. long. Var. **capitata**, L., **HEAD LETTUCE**, rosette very dense and cabbage-like. Var. **crispa**, L., **CURLED LETTUCE**, loose rosette of cut, fringed or crisped lvs. Var. **longifolia**, Lam. (*L. romana*, Gars.), **Cos and ROMAINE LETTUCE**, head upright and narrow or columnar, its lvs. obovate to oblong, obtuse, 8-12 in. long, midrib very broad.

8. HIERACIUM, L. **HAWKWEED**. More than 700 species mostly native to Eu. and S. Amer., variable, a few sometimes grown for ornament.—Per. herbs, often hirsute, with commonly leafy sts. and rosulate tuft of basal lvs.: lvs. often toothed but never deeply lobed: heads variously panicked or rarely solitary; receptacle flat, usually naked; fls. all ligulate, rays truncate and 5-toothed at apex; involucre of 1-3 series of unequal bracts: achenes oblong or columnar, crowned with stiff usually brownish pappus-bristles. (Hiera-cium: Greek *hawk*; it is said that the ancients thought that hawks sharpened their eyesight by using the sap of these plants.)

A. Heads ¼-1 in. across: lvs. mostly basal, obtuse and often apiculate. 1. *H. aurantiacum*
AA. Heads 1½-2 in. across: lvs. cauline as well as basal, acute. 2. *H. villosum*

1. **H. aurantiacum**, L. **ORANGE HAWKWEED**. **DEVILS-PAINTBRUSH**. Somewhat stoloniferous from tufted rootstocks, hirsute with long spreading hairs, the involucre dark with

black glandular hairs: lvs. mostly in a basal tuft, oblong to spatulate-oblong, 2-6 in. long, obtuse, often apiculate; st.-lvs. few, becoming bract-like: heads $\frac{1}{2}$ -1 in. across, in a naked cymose cluster at the tip of a long simple peduncle; fls. deep orange to flame color. Eu.; now extensively intro. as a bad weed in grass lands in some parts of the country, and probably no longer cult.

2. **H. villosum**, L. SHAGGY HAWKWEED. Leafy-stemmed per., silky-villous throughout: lvs. acute, the basal oblanceolate, 2-4 in. long, the cauline ovate, sessile or clasping: heads $1\frac{1}{2}$ -2 in. across, often solitary at the end of the st.; involucre without black glandular hairs; fls. bright golden. Eu.

9. **CREPIS**, L. About 200 species, mostly natives of the northern hemisphere, one a showy fl.-garden subject.—Ann., bien. or per. herbs with mostly runcinate-pinnatifid or -toothed lvs.: heads solitary or paniculate, on long peduncles; fls. all ligulate, yellow, orange or red; involucre of 2 or more series of unequal bracts; rays truncate and 5-toothed at apex: achenes columnar to fusiform crowned with soft white pappus. (Cre-pis: Greek for *sandal*; application obscure.)

C. rubra, L. Branching ann. $\frac{1}{2}$ -1½ ft. high, with leafy sts. many from the base: lvs. runcinately toothed or lobed, glabrous or nearly so, the basal tapering to a narrow winged petiole, the cauline sessile: heads solitary on long peduncles; involucre hispid; fls. red varying to flesh-colored or whitish, summer. Italy, Greece.

10. **GERBERA**, Cass. (*Perdicion*, L.). Per. herbs of S. Afr. and Asia, about 32 species, one planted for ornament.—Lvs. in a basal tuft, petiolate, entire or lobed: peduncles naked or with a few small bracts, bearing solitary heads of yellow, pink or orange fls.; rays conspicuous, in 1 or 2 rows, those of the inner row, when present, very short and sometimes tubular and 2-lipped as are the disk-fls.: achenes beaked; pappus of bristles in 2 or more series. (Ger-bera: named in honor of Traug. Gerber, a German naturalist who travelled in Russia.)—Originally spelled *Gerberia*, but the spelling *Gerbera* conserved.

G. Jamesonii, Bolus. TRANSVAAL DAISY. BARBERTON DAISY. To 1½ ft., hairy throughout, the mature lvs. very woolly beneath: lvs. numerous, the petiole 6-8 in. long, the blade 5-10 in. long, pinnately lobed or parted: heads to 4 in. across, with showy orange-flame-colored strap-shaped rays, May. (Named after Jameson, one of the discoverers of the species.) Transvaal.—Improved and garden forms have fls. white, pink, orange, salmon, violet.

11. **CHRYSANTHEMUM**, L. (incl. *Pyrethrum*, Haller. *Leucanthemum*, Mill. *Balsamita*, Desf.). Ann. and per. herbs, sometimes more or less woody at base, mostly native in the Old World, probably 160 species, yielding major ornamental subjects to hort.—Plants mostly of erect growth and the greater number much-branched, glabrous, pubescent or rarely viscid, often strong-scented, bearing usually many fl.-heads in white, pink, red, purple, yellow and intermediate colors: lvs. alternate, very various, from practically entire to lobed and multifid: heads terminating long peduncles or in corymbose clusters, many-flid., typically radiate; disk-fls. bisexual and usually fertile; ray-fls. pistillate and also mostly fertile, the rays entire or toothed; receptacle flat or convex, naked; bracts of involucre usually in several series, imbricated and appressed, the margins commonly scarious: achenes of disk- and ray-fls. much alike or those of the rays more 3-angled, all of them usually more or less striate, angled or ribbed; pappus a scale-like cup or border, or wanting. (Chrysan-themum: Greek compound *golden flower*.)—The genus is variously understood and defined, and it has been divided into genera by different authors.

- A. Herbage with pronounced sweet fragrance: lvs. not lobed, serrate: heads clustered, on short peduncles, small and usually rayless, the disk mostly not exceeding about $\frac{1}{4}$ in. across. 1. *C. Balsamita*
- AA. Herbage not sweet-smelling, often with strong pungent odor: lvs. various: rays prominent even if small.
- B. The annuals, grown from seeds each year, being common summer or fl.-garden chrysanthemums.
- C. Rays of fl.-head clear white: plant small. 2. *C. Nivellei*
- CC. Rays yellow or yellow-tinged, or ringed with yellow or red: plant robust.
- D. Achene ("seed") flat, winged: outer involucral bracts keeled. 3. *C. carinatum*
- DD. Achene angled and prismatic, not winged: bracts usually not keeled.

- E. Lvs. linear-lobed and incised, the main lower part narrowed almost to a petiole-like base: achene strongly angled but without prominent intermediate ribs. 4. *C. coronarium*
- EE. Lvs. not reduced to linear lobes, the main part usually about $\frac{1}{4}$ in. broad: achene with many deep ribs. 5. *C. segetum*
- BB. The perennials, ordinarily living over winter, commonly propagated by cuttings and division, of various sizes and habits, one of them (the usual florists' chrysanthemum) usually bloomed in autumn under glass or other protection.
- C. Plants commonly known as pyrethrum or feverfew, with finely divided fern-like foliage.
- D. Sts. terminated by 1 large head, colors various in white, pink, crimson, red, but not true yellow: achenes similar in both ray- and disk-fls. 6. *C. coccineum*
- DD. Sts. branched: heads small, the disk mostly less than $\frac{1}{2}$ in. across, aggregated in more or less definite clusters at top of plant, sometimes in close corymbs.
- E. Lf.-blades short, not exceeding 3 in. (except perhaps some of the radical lvs.), the main side lobes 2 or 3 pairs. 7. *C. Parthenium*
- EE. Lf.-blades much longer, the main side lobes 4 or more pairs and deep.
- F. Rays showy, more than $\frac{1}{4}$ in. long: lvs. finely cut and pyrethrum-like, divided to midrib. 8. *C. corymbosum*
- FF. Rays very small: lvs. pinnatifid, main divisions $\frac{1}{2}$ in. broad. 9. *C. macrophyllum*
- CC. Plants known to cultivators as chrysanthemums, marguerites, Paris daisies, including outdoor subjects and the florists' cut-fl. chrysanthemums.
- D. Radical and lower cauline lvs. about as broad as long, more or less palmate in dentation or lobing from the apex rather than from the sides: plant small, glabrous and green: heads not clustered, white tinged rose. 10. *C. arcticum*
- DD. Radical and cauline lvs. much longer than broad or else deeply lobed and divided.
- E. Texture of cauline lf.-blade thick and succulent, shape oblanceolate and obtuse, lightly toothed toward apex. 11. *C. nipponicum*
- EE. Texture of cauline lf.-blade not manifestly thick or succulent, dentation or lobing lateral, blade or main lobes ordinarily not obtuse.
- F. Blade of cauline lvs. dentate or simply lobed, not divided or multiplied as if compound.
- G. Apex of cauline lvs. long-acute, the deep teeth sharp and pointed forward: plant much-branched. 12. *C. uliginosum*
- GG. Apex of cauline lvs. obtuse or only indifferently acute, not deeply toothed: plant little branched or simple.
- H. Fl.-heads small, $1\frac{1}{2}$ in. and often much less across: lvs. narrow, remotely (separately) toothed or notched. 13. *C. Leucanthemum*
- HH. Fl.-heads large and showy, 2 in. and more across, often doubled: lvs. sometimes as much as $1\frac{1}{2}$ in. broad, shallowly and closely toothed.
- I. Branched toward top so that the st. has 3 or more heads, plant tall: st.-lvs. not much narrowed to base, broadly clasping. 14. *C. lacustre*
- II. Branched at base or below middle, or not at all, so that the sts. appear to be single-headed, plant low: st.-lvs. usually tapered to long base. 15. *C. maximum*
- FF. Blade of cauline and basal lvs. much cut and divided into narrow lobes and segms., as if compound.
- G. Leafage at base of plant, the short low sts. naked or bearing only small bracts: fl.-head solitary. 16. *C. alpinum*
- GG. Leafage borne along the tall sts. as well as at base: fl.-heads usually several to a st. or plant.
- H. Herbage manifestly glaucous, or with a "bloom."
- I. Lf.-divisions linear, strongly ascending. 17. *C. anethifolium*
- II. Lf.-divisions short, in several lateral pairs, spreading. 18. *C. cinerariaefolium*
- HH. Herbage green (in no. 19 sometimes lightly bluish, as if hybrids).
- I. Foliage glabrous, or at least not gray-pubescent or tomentose.
- J. Lobes and teeth of lvs. many, projected forward, commonly very acute at apex: involucre scales broadly hyaline-margined: plant woody at base. 19. *C. frutescens*
- JJ. Lobes and teeth of lvs. relatively few, mostly divaricate and not markedly acute: involucre scales not very broad-margined: plant hardly woody at base.
- K. Ultimate lf.-segms. very narrow, $\frac{1}{2}$ in. or less broad.
- L. Segms. linear, strongly ascending. 20. *C. Mawii*
- LL. Segms. broader and mostly very obtuse, divaricate. 21. *C. Zawadskii*
- KK. Ultimate segms. $\frac{1}{8}$ - $\frac{1}{2}$ in. broad.
- L. Length of lf.-blade ordinarily 3-5 or 6 in., lower blades with more or less acute outline, width of primary lobes often more than $\frac{1}{2}$ in. and apex not distinctly rounded but subacute: heads usually about 3 in. across. 22. *C. rubellum*

- LL. Length of lf.-blade usually 3 in. or less, apex rounded, lobes $\frac{1}{2}$ in. or less broad and teeth mostly obtuse: heads usually about 2 in. across. 23. *C. sibiricum*
- II. Foliage and sts. gray-pubescent or tomentose, with strong odor: lvs. heavy, of the ovate type, lobed one-third to two-thirds to the midrib.
- J. Rays yellow: heads many, clustered, disk usually not exceeding $\frac{1}{2}$ in. across: lvs. parted, the teeth very sharp or mucronate: undeveloped plants. 24. *C. indicum*
- JJ. Rays of many colors, sometimes much modified, and heads usually large: lvs. lobed but usually not deeply, teeth bluntish or short-acute: highly developed hort. plants, source of common cut-fl. chrysanthemums. 25. *C. morifolium*

1. *C. Balsamita*, L. COSTMARY. MINT-GERANIUM. Persistent per., kept in old yards for the sweet odor of its foliage, sometimes erroneously called "lavender"; sts. stiff, 2-4 ft., finely pubescent, much-branched along the sides, bearing many little heads on very short peduncles: lvs. oblong or oval, 2-6 in. long or the radical ones longer, obtuse, finely and obtusely serrate, often with a pair of small narrow lobes at base: heads about $\frac{1}{2}$ in. broad, usually yellowish with a few white rays; involucre bracts oblong, narrow, hyaline, obtuse: pappus a small crown. (Balsamita: an old substantive, from the balsamic odor.) W. Asia; more or less escaped in N. Amer. Var. *tanacetoides*, Hayek (*Balsamita major*, Desf. *C. major*, Auth.), heads rayless and usually smaller, about $\frac{1}{4}$ - $\frac{1}{2}$ in. across.

2. *C. Nivellei*, Br.-Blanc. & Maire. Ann.; sts. erect, about 1 ft. tall, simple, very leafy: lvs. thickish, light green or purplish, sparsely hairy to nearly tomentose, obovate, pinnately parted, blade $1\frac{1}{2}$ in. or less long, lobes cut-toothed with acute or mucronate teeth: fl.-heads solitary, 1 in. or more across, involucre whitish-hairy, rays white and retuse or dentate at apex. (Named for its collector, Commander Nivelle.) Mts., Morocco.

3. *C. carinatum*, L. (*C. tricolor*, Andr.). TRICOLOR CHRYSANTHEMUM. Glabrous simple or moderately forked ann., 2-3 ft.: lvs. somewhat succulent, remotely 2-pinnatifid into linear lobes that are obtuse or nearly so, little or not at all auricled on the st.: heads solitary and mostly long-peduncled, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. across, the rays differently colored at base so as to make a ring in the fl.-head, the disk purple, giving the heads a tricolor effect; the rays are white with ring yellow, or red with yellow ring, or brownish-purple with yellow ring, or pink with purple ring, and other combinations as also double fls.; involucre bracts broad and hyaline-margined, the outer ones keeled: achenes flat, winged or margined on either edge, not ribbed. Morocco.—Several garden races are in cult., known as *C. Burridgeanum* and otherwise.

4. *C. coronarium*, L. GARLAND CHRYSANTHEMUM. CROWN DAISY. Often taller than no. 3, stiff: lvs. not succulent, with broader and sharper-toothed divisions more closely placed, the main rachis about $\frac{1}{2}$ in. broad, manifestly auricled on st.: heads usually smaller and more likely to be full double and globular, yellow or yellowish-white; involucre bracts not keeled: achenes somewhat prismatic, strongly angled but not winged, with minor ribs between. Medit. region.—*C. spatiosum*, Bailey (var. *spatiosum*, Bailey), is a robust very leafy plant with lvs. much less divided and more simply pinnatifid, cult. in China for the young edible lvs.; to be looked for among Chinese.

5. *C. segetum*, L. CORN CHRYSANTHEMUM or CORN-MARIGOLD. Rather sparsely foliaged ann., 1-1 $\frac{1}{2}$ ft., much-branched: lvs. notched, or when pinnatifid not deeply so, the main part $\frac{1}{4}$ in. or more broad, the lobes broad-linear and more or less obtuse, base usually clasping, lowest ones narrowed to a petiole-like part: involucre bracts broad and obtuse, hyaline-margined: heads mostly long-peduncled, 1-2 in. across, golden-yellow, varying to white: achenes prismatic but not sharply angled, the ribs all prominent. A grain and field weed in Eu., N. Afr. and W. Asia, and adventive in N. Amer.—Known also as a fl.-garden ann.

6. *C. coccineum*, Willd. (*C. roseum*, Adam. *Pyrethrum roseum*, Bieb. *P. hybridum* and *P. carneum*, Hort.). COMMON PYRETHRUM. Popular per. producing a clump of finely cut very green foliage and sending up simple or sparingly forked nearly or quite glabrous sts. usually 16-30 in. tall, bearing bright heads in late spring and summer: lvs. thin, long and narrow, the lower ones 5-15 in. long with the long petiole and 3 or 4 in. broad, pinnate and the pinnae pinnatifid and segms. cut, upper st.-lvs. simply pinnatifid and sessile: heads solitary, large, $1\frac{1}{2}$ -3 in. across, the long rays white, pink, lilac, crimson, dark red (as *Pyrethrum atrosanguineum*), but not true yellow, sometimes full and double, sometimes with developed tubular fls. on the disk producing anemone forms; involucre bracts rather narrow, brown-margined. S. W. Asia.—A good florists' and cut-fl. plant.

7. *C. Parthenium*, Pers. (*Matricaria Parthenium*, L. *M. parthenoides*, *capensis*, *eximia*, Hort. *Pyrethrum Parthenium*, Smith). FEVERFEW. Bushy much-branched per., leafy, nearly glabrous, strong-scented, 1-3 ft., some of the forms very dwarf and compact and sometimes curl-lvd. and yellow-foliaged (GOLDEN FEATHER, var. *aureum*, Hort.), suitable for edgings: lvs. broad-ovate to oblong-ovate in outline, blades usually not exceeding 3 in. long and often much less on the st., the lower ones pinnate and then pinnatisect, the upper ones deeply pinnately parted, segms. only 2 or 3 pairs, $\frac{1}{4}$ in. or so broad and variously

toothed, obtuse or nearly so: heads many and aggregated, $\frac{3}{8}$ – $\frac{3}{4}$ in. across, disk yellow and rays white; in some forms the heads are discoid and in others double (all fls. rayed); involucre mostly lightly pubescent, outer bracts green-centered. (Parthenium: ancient name suggesting reputed medicinal merits.) Eu. to Caucasus; more or less spontaneous in U. S.—An old garden favorite.

8. *C. corymbosum*, L. (*Pyrethrum corymbosum*, Scop. *Matricaria corymbosa*, Desr.). Stout per. 1–4 ft., much-branched toward top, nearly or quite glabrous: lvs. tansy-like, 4–6 in. long, 2-pinnatisect into linear acute and sharp-toothed lobes, lower ones petiolate, the segms. 4 or more pairs: heads many and small in a flat-topped cluster, about $\frac{3}{4}$ in. across including the rays, slender-peduncled the showy rays white; bracts oblong, green-centered and brown-margined. Medit. region.

9. *C. macrophyllum*, Waldst. & Kit. (*Pyrethrum macrophyllum*, Willd.). TANSY CHRYSANTHEMUM. Stout per., with erect puberulent angled sts. to 3 ft.: lvs. large, nearly or quite sessile, divided well toward midrib into 4 or more pairs of long toothed segms. $\frac{1}{2}$ in. or so broad: heads many in close yarrow-like clusters, $\frac{1}{4}$ in. or less across the disk, the white or yellowish little rays not equalling the disk; involucre bracts of nearly equal length, keeled, hirsute. Hungary.

10. *C. arcticum*, L. (*Leucanthemum arcticum*, DC.). Autumn-blooming per., forming a clump, pubescent at least above, the sts. simple or branched near base, 6–12 or sometimes 18 in.: lvs. spatulate in outline, 1–3 in. long, long-narrowed to base, primarily 3-lobed or cleft with secondary lobing, the uppermost becoming linear bracts: heads solitary, 1–2 in. across, white tinged rose or lilac, numerous and attractive; involucre with tomentum that covers the top of the peduncle, bracts brown-margined and green-centered. High north and arctic regions, western and eastern hemispheres.

11. *C. nipponicum*, Matsum. (*Leucanthemum nipponicum*, Franch.). NIPPON DAISY. Subshrub, the foliage soon falling from the lower part of the woody sts. which are $1\frac{1}{2}$ –2 ft. tall, stiff, angled, nearly or quite glabrous: lvs. crowded on upper part of st., thick and stiffish, 2–3 $\frac{1}{2}$ in. long, spatulate and obtuse, bluntly serrate-dentate toward apex: heads single, terminating the sts., white-rayed and 2–3 $\frac{1}{2}$ in. across; involucre bracts obtuse, scarious-margined. Japan.—Blooms very late.

12. *C. uliginosum*, Pers. HIGH DAISY. Very tall handsome per., 4–7 ft., much-branched and finely pubescent above, with aspect of a big aster: lvs. long-lanceolate, 3–4 in. long at middle of st., very sharp-pointed and sharply upward-toothed, st.-lvs. mainly sessile: heads many, on rather short leafy peduncle or sts. in autumn, $1\frac{1}{2}$ –3 in. across, the narrow obtuse rays white; involucre bracts long-oblong, hyaline-tipped and green-centered. Eu.

13. *C. Leucanthemum*, L. OX-EYE DAISY. WHITEWEED. Weedy per., nearly or quite glabrous; sts. 1–3 ft., simple or sparingly branched, bearing terminal heads 1–2 in. across with white rays: lvs. largely basal and radical, the blades mostly 1–2 in. long and spatulate or obovate with rounded end, strongly toothed or toward base incised-pinnatifid, the st.-lvs. incised-toothed, sessile and clasping. (*Leucanthemum*: ante-Linnæan name meaning *white flower*.) A common weed eastward, nat. from Eu. and Asia.—Probably not regularly cult., although perhaps appearing in gardens; stock sometimes known under this name is likely to be *C. maximum*.

14. *C. lacustre*, Brot. (*C. latifolium*, DC.). PORTUGUESE DAISY. A taller plant than *C. maximum*, 3–6 ft., branched toward top so that the fl.-sts. are relatively shorter: lvs. mostly broader and less narrowed at base; pappus of ray-fls. 2–3-eared. Portugal.

15. *C. maximum*, Ramond. MAX DAISY. Short-lived per., sometimes treated as a bien.; sts. 12–30 in., erect, simple or sparingly long-forked, somewhat pubescent becoming glabrous: lvs. long-oblong-lanceolate, the radical ones often 1 ft. long, upper successively shorter and becoming lanceolate, coarsely and bluntly toothed, obtuse at end, the st.-lvs. usually 1 in. or less broad: heads appearing in summer and autumn, terminating the long sts., 2–3 in. across, with broad and obtuse white rays; involucre bracts broad-oblong, obtuse, hyaline-margined, more or less brown- or green-centered; pappus none. Pyrenees.—Now known in several large-headed forms, 4 in. or more across, including the Shasta Daisy; some of the forms have serrate, fringed or drooping rays. Here belong the hort. forms known as *C. Robinsonii*, King Edward VII, Glory of the Wayside, Chrysanthemum Daisy.

16. *C. alpinum*, L. Rock-garden per. 2–6 in. tall, sometimes a little more, with dissected foliage clustered at the base: lvs. green, mostly not much if any exceeding $1\frac{1}{2}$ in. long (a tomentose var.), in a cluster or rosette, divided nearly or quite to the base into very narrow small acute segms.: heads white, terminating a st. that much exceeds the basal tuft of lvs., $1\frac{1}{2}$ in. or less across, fragrant, the rays many and entire or only obscurely dentate at apex, white. High Alps.

17. *C. anethifolium*, Brouss. Differs from *C. frutescens* in the glaucous finer foliage: lvs. shorter-petioled, the segms. narrow-linear and usually more deeply cut as well as more separated or distant: fls. white but recorded as sometimes lemon-yellow. Canaries.—Now seldom seen in cult.

18. *C. cinerariæfolium*, Vis. DALMATIAN PYRETHRUM. Slender glaucous grayish-pubescent per. interesting as a source of insect powder and sometimes cult. for ornament;

sts. 12-30 in. tall, simple, overtopping the fine foliage: lvs. 6-12 in. long, including petiole, oblong or oval in outline, pinnate and then pinnatifid into linear acute segms.: heads about $1\frac{1}{2}$ in. across, on long slender peduncles or sts., solitary, the oblanceolate obtuse veined rays white and showy; involucre bracts oblong, very obtuse, hyaline-tipped and darker-centered, pubescent. Dalmatia.

19. *C. frutescens*, L. MARGUERITE or PARIS DAISY. Much-branched bush, woody at base, glabrous, 2-3 ft., producing heads freely on slender peduncles well above the foliage: lvs. thickish, oblong to ovate in outline, 2-4 in. long, petioled, 2-pinnatifid, the segms. all very sharp; heads solitary, $1\frac{1}{2}$ -2 in. across, with long narrow white or sometimes lemon-yellow rays; involucre bracts very broad and widely hyaline-margined. Canaries.—Apparently not all the stock passing as Marguerite is of this species.

20. *C. Mawii*, Hook. f. Erect slender per. to 18 in. or less, the finely cut foliage sparsely bearing lax hairs: lvs. about 1 in. long or more, narrowly pinnatifid to base into 3 almost or quite linear lobes, most of them again divided into acute linear lobelets: heads solitary on long naked upper part of sts., about $1\frac{1}{2}$ in. across, the peduncle slightly thickened at its top, rays white with rose-color on back, linear-oblong and more or less toothed at apex: achenes of ray and disk similar, cylindric-oblong and prominently ribbed. (Grown in the garden of Mr. Maw, Broseley, England.) Mts., Morocco.

21. *C. Zawadskii*, Herbieh (*C. sibiricum*, Turcz.). Smaller and more slender plant than *C. rubellum* with which it has been confused, and apparently not so much grown with us: about $1\frac{1}{2}$ ft. tall, with spare simple branching or fls. single and terminal: lvs. green and glabrous, thin in texture, $1\frac{1}{2}$ in. or less long, 5-parted nearly to rib into very narrow or linear segms. which are again toothed or lobed, the lobelets either obtuse or acute, uppermost lvs. slightly hairy: heads small, 2 in. or less across, pink, rays $\frac{3}{4}$ in. or less long. (Alexander Zawadski, 1798-1868, writer of botanical, zoological and geological works.) Galicia in Cent. Eu., Siberia.

22. *C. rubellum*, Sealy (*C. erubescens*, Hort. *Chrysoboltonia pulcherrima*, Hort.). Per. 2-3 ft. tall, more or less branched, making a compact very floriferous leafy clump, with green foliage lightly pubescent underneath: lvs. 3-5 in. long, pinnately about 5-parted nearly three-fourths to the midrib, segms. well separated and coarsely toothed or lobed, the lobes subacute and often $\frac{1}{2}$ in. or more broad; heads many, single or few to a st. but not closely clustered, $2\frac{1}{2}$ -3 $\frac{1}{4}$ in. across, pink or rose-red, rays narrow and well separated, not notched, about 1 in. or less long: achenes thin-margined, ridged in center. Nativity not determined.—It has been grown erroneously as *C. Zawadskii*. Satisfactory hardy plant, one of the forms being known as Clara Curtis, deep pink. The *C. erubescens* of Stapf is probably not in cult. outside botanic gardens; its lvs. are relatively broader and more rounded, cut only half way or less to midrib, mostly 2 in. or less long; heads about 1 in. across, rays pink; plant about 1 ft. tall; Chinese; this plant is apparently *C. naktongense*, Nakai, of Japan.

23. *C. sibiricum*, Forbes & Hemsl. (*C. Zawadskii* var. *sibiricum*, Sealy. *C. coreanum*, Hort.). Upstanding glabrous or only slightly pubescent plant 2-3 ft. tall with abundant green foliage: lvs. 2-3 in. long, main ones with rounded or obtuse outline, irregularly pinnately divided two-thirds or more to the midrib into segms. $\frac{1}{4}$ - $\frac{1}{2}$ in. wide broadening to apex, shallowly dentate into obtuse or indifferently acute or obtuse teeth: heads single terminating the sts. and frequently on short lateral erect branches, 2-2 $\frac{1}{2}$ in. across, rays white with faint tinge of rose or fading to rose, late-blooming. Siberia.

24. *C. indicum*, L. (*C. japonicum*, Thunb.). Per. with branching slender more or less lopping sts. 2-3 ft. long, herbage gray-pubescent: lvs. thin, ovate in outline, most of those on the sts. not exceeding 3 in. long, parted nearly to midrib, the small teeth acute or mucronate: heads many in small clusters, on short peduncles, the disk usually not exceeding $\frac{1}{2}$ in. across and often much less, the yellow rays not equalling the disk; outer involucre bracts broadly scarious, the midnerve being green and herbaceous. China, Japan.—Hardy undeveloped border plant, little known in cult.

25. *C. morifolium*, Ramat. (*C. sinense*, Sabine. *C. hortorum*, Bailey). FLORISTS CHRYSANTHEMUM. Stout branching per., erect or spreading, 2-5 ft., herbage gray-pubescent or tomentose: lvs. large, usually thick and heavy, lobed one-third to one-half depth of the blade, teeth short-acute or nearly blunt: heads naturally somewhat clustered, on peduncles 2-3 or more in. long, large, rays usually much exceeding disk; outer involucre scales herbaceous, with only narrow scarious margins. Cultigen, from E. Asian sources.—There is speculation on origin in hybridization with other species and subsequent selection by cultivators. Perhaps it is derivable from *C. indicum*. Known in many cult. races, some of them grown in the permanent border, others raised by florists for autumn and early winter bloom under glass; heads vary from 1 in. across in the pompons to 1 ft. in the great-fld. kinds; colors yellow, pink, lilac, shades of red, white; the fls. are sometimes quilled, and many developed forms are known. This is "the chrysanthemum" of commerce.

12. MATRICARIA, L. (incl. *Chamomilla*, Gilib.). MATRICARY. About 50 species, natives of S. Afr., the Medit. region, and the Orient, some grown as ornamentals.—Ann., bien. or per. herbs, often strongly scented: lvs. 1-3 times finely dissected:

heads peduncled, the disk-fls. yellow, those of the ray white or sometimes wanting; involueral bracts in few series; receptacle conical or ovoid, naked: achenes 3-5-ribbed on the face or sides, rounded on the back. (*Matricaria: mater*, mother, from its medicinal use.)

A. Plant a mat-forming per. with creeping sts., spring-blooming. 1. *M. Tschihatchewii*
AA. Plant an ann. with erect sts., summer and autumn-blooming.

B. Ray-fls. $\frac{1}{2}$ - $\frac{3}{4}$ in. long, spreading: achenes with 2-3 conspicuous ribs with oil glands at top. 2. *M. inodora*

BB. Ray-fls. about $\frac{1}{4}$ in. long, becoming reflexed: achenes with 3-5 faint ribs, without oil glands. 3. *M. Chamomilla*

1. *M. Tschihatchewii*, Voss (*Chamæmelum Tschihatchewii*, Boiss. *Chrysanthemum* and *Pyrethrum Tschihatchewii*, Hort.). TURFING DAISY. Mat-forming glabrous per. with creeping rooting sts., nearly scentless: lvs. 1-2-pinnate into small segms.: heads solitary at ends of naked sts. 6-12 in. high, about 1 in. across, rays white: achenes conspicuously 2-3-ribbed; pappus short, white. (Named for P. A. Tschihatchew, 1808-1890, Russian collector in Asia Minor.) Asia Minor.

2. *M. inodora*, L. (*Chrysanthemum inodorum*, L.). SCENTLESS FALSE CHAMOMILE. Diffuse branching ann., 1-2 ft. high, glabrous or nearly so, little or not at all scented: lvs. many, sessile, 2-3-pinnately divided into short narrowly linear segms.: heads $1\frac{1}{2}$ in. across, on peduncles terminating the branchlets, the 15-25 white rays acute and spreading: achenes inversely pyramidal with 2-3 conspicuous ribs; pappus a minute entire or 4-toothed border. Eu.; somewhat nat. in E. N. Amer. Var. *plenissima*, Hort. (*M. grandiflora*, Hort.), has large very double heads; known as Bridal-Rose.

3. *M. Chamomilla*, L. SWEET FALSE CHAMOMILE. Glabrous erect much-branched ann. to 2 ft. high: lvs. 2-3-pinnately dissected into short very narrowly linear segms.: heads nearly 1 in. across, on short terminal peduncles, with 10-20 truncate or emarginate white rays becoming strongly reflexed; involueral bracts about equal, the edges scarious; receptacle without scales, elongating and becoming hollow as anthesis advances: achenes with 3-5 faint ribs; pappus wanting. (*Chamomilla*: Greek *earth apple*, because of the small round heads which are said to smell like apples.) Eu., N. Asia; nat. in N. Amer.

13. **ANTHEMIS**, L. Species about 100, native to Eu. and the Medit. region, a few planted for ornament.—Ann., bien. or per. herbs, with strongly scented herbage: lvs. 1-3-pinnately dissected: heads on slender peduncles terminating the branches, many-fld., the disk yellow, the rays white or yellow and (in ours) pistillate; involueral bracts imbricated in several series, with scarious margins; receptacle conical, chaffy: achenes angled or ribbed; pappus a short crown or lacking. (*Anthemis*: Greek name of the chamomile.)

A. Lvs. with ultimate segms. linear-setaceous to filiform. 1. *A. nobilis*

AA. Lvs. with ultimate segms. broader, linear to oblong.

B. Ray-fls. white. 2. *A. montana*

BB. Ray-fls. yellow.

c. Involueral bracts margined with dark brown: pappus a persistent irregularly toothed crown. 3. *A. Sancti-Johannis*

cc. Involueral bracts not margined with brown: pappus scarcely visible. 4. *A. tinctoria*

1. *A. nobilis*, L. (*Ormenis nobilis*, Gray). CHAMOMILE. Half-spreading much-branched per. 6-12 in. high, downy and pleasantly aromatic, cult. for medicinal purposes and as a border plant: lvs. 2-pinnate into linear-setaceous or filiform segms.: heads $\frac{3}{4}$ -1 in. across, rays white; bracts of involucre obtuse, with broad scarious margins: achenes turbinate, obtusely 3-angled; pappus wanting. Eu.; escaped in N. Amer.

2. *A. montana*, L. Per. 4-10 in. high: lvs. 2-3-pinnate into linear or lanceolate segms., pubescent: heads 1-1 $\frac{1}{2}$ in. across, rays white; bracts of involucre lanceolate, acute or obtuse, with narrow brownish margins: achenes slightly 4-angled; pappus scarcely visible. S. Eu.

3. *A. Sancti-Johannis*, Stoy., Steff. & Turrill. Per. with erect sts. 2 $\frac{1}{2}$ -3 ft. high, soft-pubescent: lvs. 2-3-pinnate into oblong segms. with hard white points: heads 1 $\frac{1}{2}$ -2 in. across, rays deep orange; involueral bracts lanceolate, acute, with dark brown margins: achenes 4-angled and slightly compressed, striate; pappus a persistent irregularly toothed crown. (Named for the patron saint of the Rila Monastery, near where the plant was collected.) Bulgaria.

4. *A. tinctoria*, L. GOLDEN MARGUERITE. Bushy per. 2-3 ft. high, pubescent, with angular erect or ascending sts., used as a border plant and for cut fls.: lvs. pinnately divided, the segms. pinnatifid into ovate or oblong toothed mucronate lobes: heads 1-1 $\frac{1}{2}$ in. across, golden-yellow; bracts of involucre lanceolate, acute, inner obtuse and with scarious margins: achenes quadrangular, striate; pappus very short. Eu., Asia; somewhat escaped in N. Amer. Var. *Kelwayi*, Hort. (*A. Kelwayi*, Hort.), has more finely cut foliage and deeper yellow fls.

14. **ACHILLEA**, L. YARROW. About 100 species in the north temp. zone, a few cult. for their ornamental fls. and foliage.—Per. herbs or seldom subshrubs: lvs. mostly 1–3-pinnately parted, sometimes only toothed: heads commonly small and in dense clusters; involucre bracts imbricated, in several series; receptacle chaffy, convex or nearly flat; ray-fls. pistillate, fertile, yellow, white or pink; disk-fls. bisexual, fertile, commonly yellow: achenes strongly compressed, truncate; pappus none. (Achillea-a: virtues for healing wounds said to have been utilized by Achilles.)

- A. Ray-fls. yellow.
 - B. Lvs. toothed but not pinnate. 1. *A. Ageratum*
 - BB. Lvs. 1–2-pinnately parted.
 - c. Plant 3–5 ft. high, pubescent. 2. *A. filipendulina*
 - cc. Plant 8–12 in. high, woolly. 3. *A. tomentosa*
- AA. Ray-fls. white, pink or reddish.
 - B. Height of plant 1–3 ft.
 - c. Lvs. finely dissected: rays 4–5. 4. *A. Millefolium*
 - cc. Lvs. undivided or coarsely pinnatifid: rays 6–15.
 - d. Lf. undivided but serrate. 5. *A. Ptarmica*
 - dd. Lf. pinnatifid. 6. *A. sibirica*
 - BB. Height of plant 5–12 in.
 - c. Heads solitary. 7. *A. cgeratifolia*
 - cc. Heads several to many.
 - d. Lvs. undivided. 7. *A. ageratifolia*
 - e. Involucral bracts hairy; ray-fls. 12–13. 7. *A. ageratifolia*
 - EE. Involucral bracts nearly glabrous; ray-fls. 7–9. 8. *A. rupestris*
 - DD. Lvs. pinnatifid.
 - e. Plant stoloniferous. 9. *A. nana*
 - EE. Plant not stoloniferous.
 - f. Involucral bracts nearly glabrous: lvs. pectinate, the segms. narrow and close together. 10. *A. umbellata*
 - FF. Involucral bracts tomentose: lvs. with ultimate segms. few and separated. 11. *A. Clavennæ*

1. *A. Ageratum*, L. SWEET YARROW. Leafy-stemmed branching plant 1–1½ ft. high, glabrous or somewhat pubescent: lvs. fascicled, oblong, 1–2 in. long, obtuse, tapering to a slender petiole or the st.-lvs. sessile, toothed and the teeth serrulate: heads about ½ in. across, in dense convex-topped clusters; ray-fls. few, yellow. (*Ageratum*: from the Greek *not growing old*; herbalist and generic name.) S. Eu.

2. *A. filipendulina*, Lam. (*A. Eupatorium*, Bieb.). FERNLEAF YARROW. Stiffly erect, more or less hairy, 4–5 ft. high, the leafy sts. furrowed and glandular-spotted: lvs. 1–2-pinnatifid into linear-lanceolate toothed segms.: heads small, in dense convex compound corymbs which are often 5 in. across; ray-fls. about 5, yellow. Orient.

3. *A. tomentosa*, L. WOOLLY YARROW. Plants 8–12 in. high, forming mats, clothed with long wool: lvs. 1–3-pinnatifid into small closely spaced segms.: heads in rather small convex clusters; ray-fls. about 5, yellow. Eu., Orient.

4. *A. Millefolium*, L. MILFOIL. COMMON YARROW. Sts. simple, leafy, 1–3 ft. high: lvs. sessile, long and narrow, 1–2-pinnately parted into linear toothed segms., pubescent or nearly glabrous: heads about ¼ in. across, in flat-topped corymbs; ray-fls. about 5, white. (*Millefolium*: the lvs. cut into innumerable parts; an herbalist name.) Eu., Asia, Amer. Var. *rosea*, Desf., has pink rays, and var. *rubra*, Hort., dark pink rays.

5. *A. Ptarmica*, L. SNEEZEWORD. Sts. simple or branched above, 1–2 ft. high: lvs. linear-lanceolate, 1–3 in. long, finely toothed, sessile, nearly glabrous: heads ½–¾ in. across, in loose corymbs; ray-fls. 6–15, white. (*Ptarmica*: Greek *sneeze-producing*, in reference to the use of the root for snuff; herbalist name.) North temp. regions.—The most commonly cult. form is The Pearl, in which all the fls. are ligulate; other named kinds are Boule de Neige, Perry White and Globe.

6. *A. sibirica*, Ledeb. Sts. simple or branched, 1–5 ft. high: lvs. pinnatifid into lanceolate or oblong triangular-toothed segms., pubescent or nearly glabrous: heads ⅛–½ in. across, in many-fld. corymbs; ray-fls. 6–8, white. N. Asia.

7. *A. ageratifolia*, Boiss. (*Anthemis ageratifolia*, Sibth. & Smith). Tufted, the erect or ascending sts. 4–10 in. high: lvs. linear or linear-lanceolate, nearly entire to pinnatifid, silvery-pubescent: heads solitary, ½–1 in. across; ray-fls. 12–20, white. Balkan region. Var. *Aizoon*, Boiss. (*Ptarmica* and *Anthemis Aizoon*, Griseb.), lvs. entire or slightly toothed, heads solitary. Var. *serbica*, Hayek (*Anthemis serbica*, Nym.), lvs. entire or toothed, heads smaller, in corymbs of 2–5.

8. *A. rupestris*, Huter. Loosely tufted, the ascending or erect sts. 3–8 in. high: lvs. spatulate, mucronate, rarely deeply toothed, somewhat pubescent, densely glandular: heads about ½ in. across, in corymbs of 4–8; ray-fls. 7–9, white. S. Italy.

9. *A. nana*, L. Plant stoloniferous, sts. creeping at base, the erect flowering sts. 2–8 in. high: lvs. 1–2-pinnatifid into short acute segms., densely woolly, glandular: heads about ½ in. across, in dense corymbs; ray-fls. 6–9, white. S. Eu.

10. *A. umbellata*, Sibth. & Smith. Sts. erect, 2-6 in. high; lvs. pectinate-pinnatifid, with many narrow entire or toothed segms. close together, white-tomentose: heads about $\frac{1}{2}$ in. across, in dense corymbs; ray-fls. 7-9, white. Greece.

11. *A. Clavennæ*, L. (*A. sericea*, Vis. not Janka). Sts. erect, 4-10 in. high; lvs. pinnatifid into few well-separated entire or toothed segms., white-silky-tomentose: heads $\frac{1}{2}$ - $\frac{3}{4}$ in. across, in simple or compound corymbs; ray-fls. 5-9, white. (Named for N. Clavena von Belluno, author of an essay on related groups about 1610.) S. Eu. Var. *argentea*, Reichb. (*A. argentea*, Vis.), has densely silvery-silky foliage and simple corymbs.

15. **TANACETUM**, L. TANSY. Odorous ann. or per. herbs, of the northern hemisphere, about 35 species, with 7 native to N. Amer., yielding one old garden plant.—Lvs. alternate, dissected or entire: heads yellow, small to medium-sized, disk-shaped, corymbosely clustered or rarely solitary; involucre bracts in many series; pistillate fls. with 3-5-toothed tubular corollas; receptacle naked: achenes 5-ribbed or 3-5-angular, with broad truncate summit, bearing a coroniform pappus or none. (Tanace-tum: name of doubtful derivation.)

T. vulgare, L. (*Chrysanthemum vulgare*, Bernh.). COMMON TANSY. Robust erect per., 2-3 ft. high: lvs. pinnately divided into oblong or lanceolate segms. which are sharply serrate or pinnately cut: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. across, numerous, in a dense flat-topped cyme; ray-corollas inconspicuous, with oblique 3-toothed limb. Eu.; escaped in N. Amer.—Formerly grown for medicinal purposes and for its use as a seasoning.

16. **LONAS**, Adans. One ann. herb native in the Medit. region, planted in the fl.-garden.—Lvs. alternate, pinnatifid into linear entire segms.: heads of disk-fls. only, borne in dense corymbs; involucre bracts imbricated in many series; receptacle chaffy: achenes prominently 5-angled, with toothed coroniform pappus. (Lonas: of uncertain derivation.)

L. annua, Vines & Druce (*Athanasia annua*, L. *L. inodora*, Gaertn.). To 1 ft., branching, glabrous: heads yellow, about $\frac{3}{8}$ in. across, in corymbs to 2 in. across. Italy, Sicily, N. W. Afr.—Sometimes called African Daisy.

17. **ARTEMISIA**, L. About 200 species, mostly in the northern hemisphere and most abundant in arid regions, several grown for ornament and also for medicinal and aromatic qualities.—Herbs or low shrubs, bitter-aromatic: lvs. alternate, often dissected: heads wholly discoid, small and inconspicuous, numerous, paniculately disposed and generally nodding; fls. yellow or whitish, bisexual, marginal pistillate fls. fertile or lacking; involucre imbricated in several rows; receptacle glabrous or pubescent, not chaffy: achenes without pappus. (Artemis-ia: in mythology, Artemisia, wife of Mausolus.)

- A. St.-lvs. entire or somewhat lobed.
- B. Plant green and glabrous. 1. *A. Dracuncululus*
- BB. Plant silvery-pubescent to white-tomentose.
- C. Marginal pistillate fls. lacking: plant a shrub. 2. *A. tridentata*
- CC. Marginal pistillate fls. present: plant an herb.
- D. Upper st.-lvs. ovate-lanceolate. 3. *A. Purshiana*
- DD. Upper st.-lvs. linear or nearly so. 4. *A. albul*
- AA. St.-lvs. pinnatisect to 2-3-pinnate, or palmatisect.
- B. Foliage green and glabrous or nearly so.
- C. Lvs. coarsely divided. 5. *A. lactiflora*
- CC. Lvs. finely dissected.
- D. Plant a subshrub: ultimate lf.-segms. filiform. 6. *A. Abrotanum*
- DD. Plant an ann.: ultimate lf.-segms. not filiform. 7. *A. annua*
- BB. Foliage silvery-pubescent, at least beneath.
- C. Lf. palmately divided.
- D. Infl. a simple raceme or corymb.
- E. Heads in loose rather leafy racemes. 8. *A. laxa*
- EE. Heads in small dense corymbs. 9. *A. glacialis*
- DD. Infl. of paniced racemes. 10. *A. frigida*
- CC. Lf. pinnately divided.
- D. Lvs. finely dissected, the ultimate segms. linear.
- E. Involucre white-tomentose: plant gray-pubescent. 11. *A. pontica*
- EE. Involucre somewhat hairy but not white-tomentose: plant green in var. *viridis*. 12. *A. sacrorum*
- DD. Lvs. coarsely lobed or divided.
- E. Upper surface of lvs. green and glabrous. 13. *A. vulgaris*
- EE. Upper surface of lvs. white-pubescent.
- F. Pubescence silky: heads $\frac{1}{4}$ in. across; receptacle pubescent. 14. *A. Absinthium*
- FF. Pubescence woolly: heads $\frac{1}{4}$ in. across; receptacle glabrous. 15. *A. Stelleriana*

1. *A. Dracunculus*, L. TARRAGON. ESTRAGON. Green glabrous per. 2 ft. high, with erect branched sts.: basal lvs. 3-parted at tip; st.-lvs. linear or lanceolate, 1-4 in. long, entire or small-toothed: heads whitish-green, nearly globular, $\frac{1}{4}$ – $\frac{1}{2}$ in. across, in a spreading panicle; fls. of two kinds, pistillate and bisexual, the latter sterile; receptacle glabrous. (*Dracunculus*: *little dragon*, the root coiled serpent-like; an herbalist name.) Eu.—Cult. for its lvs. which are used for seasoning.

2. *A. tridentata*, Nutt. SAGE-BRUSH. Shrub to 12 ft., much-branched, silvery-pubescent: lvs. wedge-shaped, $\frac{1}{2}$ – $1\frac{1}{2}$ in. long, obtusely 3-7-toothed at apex or upper ones entire: heads numerous, about $\frac{1}{2}$ in. across, in dense panicles; fls. all bisexual and fertile; receptacle glabrous. B. C. to Calif. and Neb.

3. *A. Purshiana*, Bess. Per. 1-2 ft. high, sts. and lvs. white-woolly on both sides: lvs. entire or lower coarsely toothed, oblanceolate to ovate-lanceolate, 1-2 in. long; heads white, about $\frac{1}{2}$ in. across, in spike-like panicles; receptacle glabrous; bisexual fls. fertile, marginal fls. pistillate. (Named for F. T. Pursh, page 50.) B. C. to Calif. and Neb.

4. *A. albula*, Woot. SILVER KING ARTEMISIA. Per. with slender spreading branches 1-3 $\frac{1}{2}$ ft. high, sts. and lvs. white-woolly on both sides: lower lvs. ovate or obovate, $\frac{1}{2}$ –2 in. long, usually with 3-5 lanceolate lobes; upper lvs. linear or nearly so, entire or toothed: heads about $\frac{1}{2}$ in. across, in racemes often forming panicles; receptacle glabrous; bisexual fls. fertile, marginal fls. pistillate. Colo. to Tex. and Mex.

5. *A. lactiflora*, Wall. WHITE MUGWORT. Erect per. to 4 ft., the sts. and main veins of lvs. somewhat hispidulous-roughened, otherwise glabrous: st.-lvs. pinnatifid or pinnately parted into large broad-lanceolate toothed or incised segms., pale beneath: heads white, slightly more than $\frac{1}{4}$ in. across, loosely paniced; receptacle glabrous; bisexual fls. fertile, marginal fls. pistillate. China.—Resembling *A. vulgaris*.

6. *A. Abrotanum*, L. SOUTHERNWOOD. OLD MAN. Green subshrub to 5 ft., sts. much-branched and rather strict: lvs. $1\frac{1}{2}$ –2 $\frac{1}{2}$ in. long, 1-3-pinnately divided, the divisions fine-linear, glabrous or slightly pubescent: heads yellowish-white, $\frac{1}{2}$ in. across, in a loose panicle; receptacle glabrous; involucre pubescent; bisexual fls. fertile, marginal fls. pistillate. (*Abrotanum*; from the Greek *elegant*, in reference to the form of the lvs. and their aromatic odor; herbalist name.) Eu.; somewhat nat. in N. Amer.

7. *A. annua*, L. SWEET WORMWOOD. Sweet-scented glabrous ann. 1-5 ft. high: lvs. 1-2 $\frac{1}{2}$ in. long, 1-2-pinnately divided into lanceolate-oblong deeply cut segms.: heads yellow, about $\frac{1}{2}$ in. across, in loose panicles; receptacle glabrous; involucre glabrous; bisexual fls. fertile, marginal fls. pistillate. Asia; nat. in N. Amer.

8. *A. laxa*, Fritsch (*A. mutellina*, Vill. *Absinthium laxum*, Lam.). Tufted per. with erect or ascending sts. 4-8 in. high, silvery-pubescent: lvs. long-petioled, the blade palmatisect into linear-lanceolate acute entire or toothed segms.: heads yellow, about $\frac{1}{2}$ in. across, in loose rather leafy racemes; receptacle pubescent; bisexual fls. fertile, marginal fls. pistillate. Alps.

9. *A. glacialis*, L. Tufted per. with erect or ascending sts. 2-6 in. high, silky-silvery-pubescent: lvs. petioled, 1-3-palmatisect into linear-lanceolate short segms.: heads yellow, about $\frac{1}{2}$ in. across, in small dense corymbs; receptacle pubescent; bisexual fls. fertile, marginal fls. pistillate. Alps.

10. *A. frigida*, Willd. Per. with woody decumbent or ascending sts. 1-1 $\frac{1}{2}$ ft. high, silky-silvery-pubescent: lvs. $\frac{1}{2}$ – $1\frac{1}{2}$ in. long, ternately or quaternately palmatisect into short linear entire segms., upper lvs. sessile: heads yellow, about $\frac{1}{2}$ in. across, in racemes forming narrow leafy panicles; receptacle pubescent; bisexual fls. fertile, marginal fls. pistillate. Alaska to Minn. and Tex., Siberia.

11. *A. pontica*, L. ROMAN WORMWOOD. Erect, shrubby, 1-4 ft. high: lvs. $\frac{1}{2}$ –2 in. long, 2-pinnatisect into linear lobes gray-pubescent on both sides, denser beneath: heads whitish-yellow, globular, about $\frac{1}{2}$ in. across, nodding, borne in a long open panicle; receptacle glabrous; involucre white-tomentose; bisexual fls. fertile, marginal fls. pistillate. Eu.; escaped in E. N. Amer.

12. *A. sacrorum*, Ledeb. RUSSIAN WORMWOOD. Subshrub to 5 ft., gray-pubescent: lvs. 2-3 in. long, long-petioled, pinnatisect and the segms. again pectinate, the rachis winged: heads 15-20-fl., about $\frac{1}{2}$ in. across, nodding, in slender racemes forming large terminal panicles; receptacle glabrous; involucre somewhat hairy; bisexual fls. fertile, marginal fls. pistillate. Russia, Siberia. Var. *viridis*, N. Taylor, SUMMER-FIR, is of pyramidal habit to 10 ft., grown as an ann., with rich green much dissected foliage.

13. *A. vulgaris*, L. MUGWORT. Erect paniculately branched per. 2-4 ft. high, sts. often purplish: lvs. 2-4 in. long, fragrant, white-tomentose beneath, soon green above, 2-pinnately cleft into lanceolate lobes; upper lvs. sometimes linear: heads many, oblong, yellowish, $\frac{1}{4}$ – $\frac{1}{2}$ in. across, spicate-paniculate; receptacle glabrous; involucre tomentose; bisexual fls. fertile, marginal fls. pistillate. Eu., Asia; nat. in N. Amer.

14. *A. Absinthium*, L. COMMON WORMWOOD. ABSINTHIUM. Spreading and branchy almost shrubby per. 2-4 ft. high, white-silky: lvs. 2-5 in. long, 2-3-pinnately parted into oblong obtuse lobes: heads $\frac{1}{2}$ in. across, numerous, in leafy panicles; receptacle hairy;

bisexual fls. fertile, marginal fls. pistillate. (Absinthium: Latin name of wormwood, associated with its bitter taste; also herbalist name.) Eu.; escaped in N. Amer.

15. **A. Stelleriana**, Bess. BEACH WORMWOOD. OLD WOMAN. DUSTY MILLER. Densely white-tomentose per. 2 ft. high, from a creeping woody base: lvs. 1-4 in. long, pinnatifid, the lobes oblong and obtuse: heads yellow, $\frac{1}{4}$ in. across, many-fl'd., in a narrow spike-like panicle; receptacle glabrous; bisexual fls. fertile, marginal fls. pistillate. (Bears name of G. W. Steller, 1709-1745, German collector in Russia.) Coasts, N. E. Asia, Que. to N. J.

18. **SANTOLINA**, L. Shrubs or rarely herbs of about 8 species, mostly from the Medit. region, useful as low border or edging plants.—Herbage aromatic; lvs. alternate, pinnately toothed or lobed or finely divided: heads many-fl'd., of disk-fls. only, yellow or rarely white, solitary on long peduncles; involucre mostly campanulate, the bracts imbricated, appressed; receptacle with chaffy bracts: achenes angled, without pappus. (Santoli-na: derivation of name doubtful.)

A. Plant gray-tomentose. 1. *S. Chamæcyparissus*
AA. Plant green and glabrous. 2. *S. virens*

1. **S. Chamæcyparissus**, L. (*S. incana*, Lam.). LAVENDER-COTTON. Much-branched evergreen subshrub $1\frac{1}{2}$ -2 ft. high, silvery-gray and tomentose: lvs. $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long, pinnately divided into minute ovate-oblong segms.: heads yellow, globular, $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., summer. (Chamæcyparissus: Greek *dwarf* and *cypress*, the lvs. resembling those of the cypress.) Medit. region.

2. **S. virens**, Mill. (*S. viridis*, Willd.). Spreading per. to 15 in., green and glabrous: lvs. 1-2 in. long, narrow-linear, with very short acute teeth: heads yellow, to $\frac{3}{8}$ in. across. Medit. region.

19. **COTULA**, L. Ann. or per. creeping or tufted herbs, one grown in the rock-garden; 50-60 species of wide distribution in the southern hemisphere.—Lvs. alternate, pinnatifid or rarely entire: heads small, yellow, solitary on long peduncles, of disk-fls. only; involucre bracts in 2 or more series; receptacle without scales: achenes compressed, without pappus. (Cot-ula: Greek for *small cup*.)

C. squalida, Hook. f. (*Leptinella squalida*, Hook. f.). Per., branches creeping 1 ft. or more, soft-hairy: lvs. linear-obovate, 1-2 in. long, deeply pinnatifid into cut segms.: heads unisexual, the pistillate to $\frac{1}{2}$ in. across, on peduncles 1-3 in. high; involucre bracts purplish, often incurved and concealing the florets. New Zeal.

20. **LAYIA**, Hook. & Arn. Low ann. herbs of about 14 species in W. N. Amer., one cult. for the showy fls.—Simple or branching, stipitate-glandular, flowering in spring or early summer: lvs. chiefly alternate, all entire or some, particularly the lower, pinnately toothed or lobed: heads showy, solitary, on peduncles terminating the sts. or branches; rays 8-20, yellow or white, with 3-toothed ligules; disk-fls. with 5-toothed tubular corolla; receptacle bearing a series of chaffy bracts between the ray- and disk-fls., sometimes additional ones among the disk-fls.: ray-achenes without pappus, inclosed by the involucre bracts; disk-achenes with pappus of bristles or awns. (La-yia: Geo. Tradescant Lay, flourished about 1825-1843, naturalist in Beechey's voyage.)

L. elegans, Torr. & Gray (*Madaroglossa elegans*, Nutt.). Diffuse branching ann. to 2 ft., more or less hirsute-pubescent throughout: lvs. oblong or linear, to 3 in. long, toothed or pinnatifid: heads large and showy, on naked peduncles; involucre bracts very unequal, the longer alternating with the shorter; rays 10-12, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, yellow or sometimes white-tipped; disk yellow: pappus of stiff bristles and shorter soft interlaced hairs. Calif.

21. **PARTHENIUM**, L. Shrubs or herbs of perhaps a dozen species in Amer., one grown as a source of rubber.—Lvs. alternate: heads small, in corymbs or panicles; ray-fls. few and short, pistillate and fertile, white or yellow; disk-fls. bisexual and sterile, corolla 5-toothed, style undivided; involucre with nearly equal bracts imbricated in 2 or 3 series; receptacle chaffy: achenes flattened, adnate to scales of receptacle, bearing persistent rays on summit; pappus of scales or awns. (Parthenium: ancient name.)

P. argentatum, Gray. GUAYULE. Much-branched shrub to 3 ft.: lvs. lanceolate to ovate-lanceolate, entire or with few lobes, $\frac{1}{2}$ -2 in. long, silvery-pubescent on both sides: heads $\frac{1}{4}$ in. across, in long-peduncled cymes. Mex., Tex.

22. **ECHINACEA**, Moench (*Brauneria*, Neck.). **PURPLE CONEFLOWER**. Five species in N. Amer., more or less grown in the border or wild-garden.—Coarse per. herbs with thick black roots of pungent taste and stout erect sts.: lvs. alternate, simple, the lower long-petioled: heads large, solitary, on long peduncles terminating the sts. and few branches; involucre bracts lanceolate, herbaceous, imbricated in 2 or more series, finally reflexed; disk convex becoming ovoid or conic; bracts of the receptacle persistent, narrowed to a rigid cusp surpassing the disk-fls.; rays rose-purple or rose-color, withering-persistent, sterile: achenes quadrangular; pappus a thick crown, toothed at the angles. (*Echina*-cea: Greek for *hedgehog*, alluding to the sharp-pointed bracts of the receptacle.)

- A. Lvs. ovate to ovate-lanceolate, commonly denticulate or serrate.....1. *E. purpurea*
 AA. Lvs. broadly lanceolate to nearly linear, entire.....2. *E. angustifolia*

1. *E. purpurea*, Moench (*Rudbeckia purpurea*, L. *Brauneria purpurea*, Britt.). Stout coarse per. 2-5 ft. high, smooth and glabrous or rough with short hispid hairs: lvs. ovate-lanceolate or the lower broadly ovate, 3-8 in. long, commonly denticulate or serrate, with short winged petiole, or the lower with elongate barely margined petiole: heads solitary on stout terminal naked peduncles; rays purple (rarely almost white), broadish, at first 1 in. long, becoming 3 in. long, 2-toothed at apex, spreading or drooping; disk purplish. Pa. to Ga. and La.

2. *E. angustifolia*, DC. (*Brauneria angustifolia*, Heller). Mostly simple, 1-2 ft. high, sparsely or densely hispid: lvs. lanceolate to nearly linear, 3-8 in. long, entire, all attenuate at base, the lower into slender petioles; heads and fls. nearly of *E. purpurea*, but spreading; rays about 1 in. long; fruiting disk often 1 in. high. Sask. to Tex.

23. **RUDBECKIA**, L. **CONEFLOWER**. Coarse summer-flowering herbs, native in N. Amer., a number cult. for their showy fls.; about 30 species.—Mostly per., sometimes ann. or bien.: lvs. alternate, simple or compound: heads pedunculate, commonly showy, terminating the sts. and branches; involucre often foliaceous, loose; rays yellow, sometimes with brownish base, often becoming reflexed; disk hemispheric to columnar, greenish or yellowish to purplish-black: achenes 4-angled; pappus crown-like, cup-shaped or none. (*Rudbeck*-ia: in honor of Olof Rudbeck, 1660-1740, Swedish botanist and counsellor of Linnæus.)

- A. Base of upper lvs. cordate- or subcordate-clasping.....1. *R. maxima*
 AA. Base of upper lvs. not cordate-clasping.
 B. Disk greenish or yellowish.
 cc. Margin of lvs. entire or barely dentate.....2. *R. nitida*
 cc. Margin of lvs. (upper st.-lvs.) 3-cleft.....3. *R. laciniata*
 BB. Disk brown or dark purple.
 c. Lower lvs. deeply 3-cut.
 D. Plant bien.: st.-lvs. subsessile: disk black-purple.....4. *R. triloba*
 DD. Plant per.: st.-lvs. distinctly petiolate: disk dull brownish.....5. *R. submontosa*
 cc. Lower lvs. not deeply 3-cut.
 D. Style-branches subulate: pappus none: plant densely hispid.
 E. Rays 1-2 in. long: lvs. 2-5 in. long, the lower petioled.....6. *R. serotina*
 EE. Rays $\frac{1}{2}$ -1 in. long: lvs. 1-2 in. long, all sessile.....7. *R. bicolor*
 DD. Style-branches short and obtuse: pappus a short crown: plant pubescent.
 E. Rays $\frac{3}{4}$ -1 in. long: lvs. mostly entire.....8. *R. fulgida*
 EE. Rays to 1½ in. long: lvs. irregularly serrate.....9. *R. speciosa*

1. *R. maxima*, Nutt. Glabrous glaucous per. 4-9 ft. high: lvs. broadly ovate to oblong, mostly obtuse, minutely toothed or entire, the larger to 1 ft. long; upper st.-lvs. cordate-clasping: heads solitary or few, long-peduncled; rays yellow, 1-2 in. long, drooping; disk brownish, conic or columnar, 1-2 in. long; style-branches short and obtuse: pappus conspicuous. Mo. to Tex.

2. *R. nitida*, Nutt. Per. with sts. simple or nearly so, 2-4 ft. high, glabrous: lvs. bright green, entire or minutely toothed, the basal and lower cauline ovate-spatulate to lanceolate-oblong, petioled, the upper oblong to lanceolate, mostly acute, sessile, 3-6 in. long: heads solitary or few, long-peduncled; rays several or numerous, pure yellow, drooping; disk finally columnar, 1-2 in. long; style-branches short and obtuse: pappus conspicuous. Ga. to Fla. and Tex.

3. *R. laciniata*, L. Branching per. 2-12 ft. high, smooth and glabrous or more or less roughened with short stiff hairs: lvs. broad, the basal pinnately divided into 5-7 often 2-3-cleft segms.; st.-lvs. 3-5-parted or -cleft, those of the branches few-toothed or entire: heads solitary or few, long-peduncled; involucre bracts loose and irregular, foliaceous; rays yellow, few or several, oblanceolate, 1-1½ in. long, soon drooping; disk greenish-yellow; style-branches short and obtuse: pappus a short crown. Que. to Fla. and Ariz. Var. *hortensia*, Bailey, **GOLDEN-GLOW**, a full double form common in cult.

4. *R. triloba*, L. BROWN-EYED SUSAN. Bright green glabrous or sparsely short-hispid bien. blooming the first year, 2-5 ft. high; basal lvs. petiolate, the st.-lvs. ovate-lanceolate to broader, with cuneate subsessile base, coarsely serrate, or the upper lanceolate and nearly entire, the lower 3-lobed or -parted; heads short-peduncled; involucre bracts foliaceous, mostly linear, unequal, in 1-2 series, soon reflexed; rays 8-10, $\frac{1}{2}$ -1 in. long, deep yellow or with orange or brown-purple base; disk black-purple, $\frac{1}{2}$ in. across; style-branches short and obtuse; pappus a minute crown. N. J. to Ga. and La.

5. *R. submontosa*, Pursh. SWEET CONEFLOWER. Leafy gray-pubescent per., 2-5 ft. high, branching above; lvs. nearly all petioled, serrate, ovate or 3-lobed and the terminal lobe ovate, 3-5 in. long; involucre bracts foliaceous, soon reflexed; rays numerous, 1-1 $\frac{1}{2}$ in. long, yellow, sometimes with dark base; disk dull brownish, $\frac{1}{2}$ in. broad; style-branches short and obtuse; pappus a short crown. Ill. to Tex.

6. *R. serotina*, Nutt. BLACK-EYED SUSAN. YELLOW DAISY. Rough-hairy bien. or sometimes ann., 1-3 ft. high; lvs. oblong to lanceolate, subentire, 2-5 in. long, the lower with margined petioles; rays golden-yellow or sometimes deeper colored toward base, 1-2 in. long; disk nearly black becoming dull brown; style-branches subulate; pappus none. E. Rocky Mts. to Newf.—Known mostly as *R. hirta* but this Linnean species differs in broader coarsely toothed lvs., and ranges from W. Mass. to Ga. and Ala.

7. *R. bicolor*, Nutt. Bristly ann. simple or branching, 1-2 ft. high; lvs. lanceolate to oblong or obovate, mostly sessile and nearly entire, 1-2 in. long; rays $\frac{1}{2}$ to barely 1 in. long, wholly yellow or with lower half or base dark-colored; disk black, $\frac{3}{4}$ in. high; style-branches subulate; pappus none. Ark. and Tex.—A hort. var., *superba*, ERFURT CONEFLOWER, has heads 2 in. across, rays yellow above, purplish-brown below; it is uncertain whether this var. belongs here or to *R. serotina*.

8. *R. fulgida*, Ait. Hairy per. 1-2 ft. high; lvs. mostly entire, narrowly to oblong-lanceolate, the lowest and basal spatulate-lanceolate, petiolate, 2-4 in. long; foliaceous bracts of involucre often wide, $\frac{1}{2}$ -1 in. long; rays 12-14, golden-yellow or with orange base, as long as the bracts; disk black-purple, over $\frac{1}{2}$ in. diam.; style-branches short and obtuse; pappus a minute crown. Pa. to Mo., and Tex.

9. *R. speciosa*, Wenderoth (*R. Neumanii*, Loud.). Per. 1-3 ft. high, sparsely hairy, the spreading branches ending in long naked peduncles; basal and lower st.-lvs. oblong or ovate, petiolate, the upper ovate-lanceolate to lanceolate, irregularly serrate, 2-5 in. long; rays 12-20, yellow, often orange at base, at length $1\frac{1}{2}$ in. long; disk brown-purple, $\frac{3}{8}$ - $\frac{1}{2}$ in. high at maturity; style-branches short and obtuse; pappus a short crown. Pa. to Mich., Ark. and Ala.

24. RATIBIDA, Raf. (*Lepachys*, Raf.). CONEFLOWER. Per. herbs, of 5 species in N. Amer., sometimes planted.—Lvs. alternate, pinnately divided: heads terminal and solitary on long peduncles; involucre of 2 series, the outer longer and reflexed or spreading; receptacle narrow-columnar, with chaffy pubescent bracts; ray-fls. yellow to purplish, neutral, spreading or reflexed, toothed; disk-fls. bisexual and fertile: achenes flattened, margined or winged; pappus none or of few teeth. (Ratibida: name of uncertain meaning.)

A. Ray-fls. $\frac{1}{2}$ - $\frac{3}{4}$ in. long. 1. *R. columnifera*
AA. Ray-fls. 1-2 $\frac{1}{2}$ in. long. 2. *R. pinnata*

1. *R. columnifera*, Woot. & Standl. (*R. columnaris*, D. Don. *Rudbeckia columnifera*, Nutt. *Lepachys columnaris*, Torr. & Gray. *L. columnifera*, Macb.). Rough-hairy, 1-2 $\frac{1}{2}$ ft. high; segms. of lf. linear to lanceolate, entire or 3-parted: ray-fls. 3-7, yellow, broad-oval, $\frac{1}{2}$ - $\frac{3}{4}$ in. long; disk 1-2 in. long. Ill. to Mont. and Mex. Var. *pulcherrima*, Woot. & Standl. (*Obeliscaria pulcherrima*, DC.), has rays partly or wholly brown-purple.

2. *R. pinnata*, Barnhart (*Rudbeckia pinnata*, Vent. *Lepachys pinnata*, Torr. & Gray). Rough-hairy, 3-5 ft. high; segms. of lf. linear to lanceolate, serrate or entire, 3-nerved: ray-fls. 5-10, yellow, oblong-lanceolate, 1-2 $\frac{1}{2}$ in. long; disk $\frac{1}{2}$ -1 in. long. Ont. to Fla. and La.

25. SILPHIUM, L. ROSINWEED. Per. herbs of over 30 species in N. Amer., a few planted in the border.—Lvs. alternate or opposite, entire, toothed or pinnate: heads yellow, sunflower-like, in peduncled corymbs or panicles; involucre bracts imbricated in few series; receptacle flat, with chaffy bracts; ray-fls. in 2-3 series, fertile; disk-fls. bisexual but sterile: achenes conspicuously flattened, winged; pappus of awns or none. (Sil-phium: ancient name, referring to the resinous juice.)

A. Lvs. coarsely toothed, the upper connate-perfoliate. 1. *S. perfoliatum*
AA. Lvs. pinnatifid, not connate-perfoliate. 2. *S. laciniatum*

1. *S. perfoliatum*, L. CUP-PLANT. INDIAN CUP. Sts. square, glabrous, 4-8 ft. high; lvs. opposite, ovate, 6-12 in. long, coarsely toothed, the upper connate-perfoliate, the lower narrowed to margined petioles, rough-pubescent; heads 2-3 in. across. Ont. to Ga. and La.

2. *S. laciniatum*, L. COMPASS-PLANT. Sts. terete, rough-hispid, 6-12 ft. high: basal lvs. 1 ft. or more long, pinnate into lanceolate or linear entire or pinnatifid segms., long-petioled; st.-lvs. alternate, sessile or clasping, smaller and less divided: heads 2-5 in. across. Ohio to Tex.

26. *TITHONIA*, Desf. Tall herbs, woody at base, of about 10 species in Mex. to Cent. Amer., grown as annuals in the N. or out-of-doors in mild climates.—Lvs. mostly alternate, petioled, 3-nerved: heads yellow, sunflower-like, borne on long fistulose peduncles enlarged above; involucre bracts in 2-5 series, nearly equal or graduated; receptacle convex, with stiff striate scales; ray-fls. showy, neutral; disk-fls. bisexual and fertile: achenes slightly flattened or 4-sided; pappus of awns or scales, persistent. (*Tithonia*: named for Tithon, consort of Aurora.)

A. Heads 2-3 in. across; involucre bracts acute or acuminate.....1. *T. rotundifolia*
AA. Heads $2\frac{1}{2}$ -6 in. across; involucre bracts rounded.....2. *T. diversifolia*

1. *T. rotundifolia*, Blake (*Tagetes rotundifolia*, Mill. *Tithonia speciosa*, Hook.). To 6 or 8 ft.: lvs. broad-ovate, 3-10 in. long, acuminate, crenate or the lower 3-lobed, pubescent at least on veins: heads 2-3 in. across; involucre 2 series of nearly equal acute or acuminate bracts. Mex., Cent. Amer.; nat. in W. Indies.

2. *T. diversifolia*, Gray (*Mirasolia diversifolia*, Hemsl.). To 15 ft. or more: lvs. ovate or triangular-ovate, 3-8 in. long, acuminate, usually 3-5-lobed, pubescent, paler beneath: heads $2\frac{1}{2}$ -6 in. across; involucre 4 series of graduated broadly rounded bracts or the outer somewhat acute. Mex., Cent. Amer.

27. *HELIANTHUS*, L. SUNFLOWER. Mostly a N. American genus of about 100 species, a number grown as ornamentals and one for its edible tubers.—Rather coarse ann. or per. herbs: lvs. simple, usually opposite below and alternate above: heads solitary or corymbed, on peduncles terminating the sts. and branches: summer and autumn bloomers; involucre bracts in 2 to several series, the outer often leafy at tips; ray-fls. neutral, yellow, usually conspicuous; disk-fls. bisexual and fertile, yellow, brown or purplish; receptacle flat or convex, with chaffy bracts: achenes obovate, slightly flattened; pappus of 2 scale-like awns, deciduous. (*Helianthus*: Greek *helios*, the sun, and *anthos*, a flower.)

- A. Disk brown or purple.
 - B. Shape of lvs. linear, entire.
 - c. Sts. glabrous.....1. *H. salicifolius*
 - cc. Sts. hispid.....2. *H. angustifolius*
 - BB. Shape of lvs. broad-lanceolate to ovate, toothed.
 - c. Plant per.: lvs. opposite.
 - D. Lvs. abruptly contracted into winged petioles: heads about 2 in. across. 3. *H. atrorubens*
 - DD. Lvs. gradually narrowed into petioles: heads $2\frac{1}{2}$ -4 in. across.....4. *H. rigidus*
 - cc. Plant ann.: lvs. alternate.
 - D. Pubescence white-silky.....5. *H. argophyllus*
 - DD. Pubescence scabrous-hispid.
 - E. Involucre bracts ovate or ovate-lanceolate, strongly ciliate.....6. *H. annuus*
 - EE. Involucre bracts narrow-lanceolate, scarcely ciliate.....7. *H. cucumerifolius*
 - AA. Disk yellowish.
 - B. Lower lvs. cordate-clasping.....8. *H. mollis*
 - BB. Lower lvs. petioled or attenuate at base.
 - c. Lvs. prevailing lanceolate.
 - D. Rays pale yellow: lvs. rough above, only slightly so beneath.....9. *H. giganteus*
 - DD. Rays deep yellow: lvs. very rough on both sides.....10. *H. Maximilianii*
 - cc. Lvs. prevailing ovate or ovate-lanceolate.
 - D. Sts. glabrous.....11. *H. decapetalus*
 - DD. Sts. rough or hairy.
 - E. Roots tuberous: lvs. abruptly contracted into winged petioles.....12. *H. tuberosus*
 - EE. Roots not tuberous: lvs. gradually narrowed to petioles.....13. *H. latiflorus*

1. *H. salicifolius*, A. Dietr. (*H. orgyalis*, DC.). Per. 8-10 ft. high, the strict sts. glabrous, very leafy to the top: lvs. mostly alternate, linear or lanceolate to almost filiform, 8-16 in. long, slightly scabrous, drooping, the lower petiolate; heads numerous, 2 in. across; involucre bracts linear-subulate, acuminate-aristate, slightly ciliate; rays lemon-yellow; disk brown or purplish. Mo. to Colo. and Tex.

2. *H. angustifolius*, L. SWAMP SUNFLOWER. Per. 2-7 ft. high, sts. hispid: lvs. mostly alternate, linear, 2-7 in. long, entire, margins becoming revolute, sessile, slightly scabrous and pubescent: heads few or solitary, 2-3 in. across; involucre bracts linear-lanceolate, acute or acuminate, pubescent; rays bright yellow; disk purple. Swamps, N. Y. to Fla. and Tex.

3. *H. atrorubens*, L. (*H. sparsifolius*, Hort.). DARKEYE SUNFLOWER. Rough-hairy per. 2-5 ft. high, the hispid sts. forking above: lvs. thin, ovate to ovate-lanceolate, 3-10 in.

long, serrate, abruptly contracted into winged petioles, scabrous-hispid, opposite, the few st.-lvs. alternate; heads about 2 in. across, corymbed; involueral bracts oblong, mucronate, slightly ciliate; rays deep yellow; disk dark red. Va. to Fla. and La.

4. *H. rigidus*, Desf. (*Harpalum rigidum*, Cass. *Helianthus scaberrimus*, Ell.). STIFF SUNFLOWER. Per. 1-8 ft. high, sts. strict, sparingly branched, rough or hairy; lvs. opposite, firm, thick, oblong- to ovate-lanceolate, 6-12 in. long, entire or slightly toothed, gradually narrowed into petioles, scabrous on both sides; heads showy, $2\frac{1}{2}$ -4 in. across, long-stalked, solitary or few; involueral bracts ovate, obtuse or acute, ciliate; disk purple or brown. Ill. to Ga. and Tex.—Varies under cult. in doubling (multiplication of rays).

5. *H. argophyllus*, Torr. & Gray. SILVERLEAF SUNFLOWER. Ann., the usually solitary sts. 4-6 ft. high, soft gray with dense silky pubescence especially on the upper branches; lvs. alternate, ovate, 4-8 in. long, petioled, slightly toothed, densely pubescent; heads 3 in. or more across; involuere densely silky, the bracts ovate, acuminate; disk brownish-purple. Tex.

6. *H. annuus*, L. COMMON SUNFLOWER. Robust rough-hairy ann. 3-12 ft. high, sts. often mottled; lvs. mostly alternate, long-petioled, ovate, acute or acuminate, 4-12 in. long, serrate, the lower cordate; heads 3-6 in. across in wild specimens, sometimes 14 in. in cult.; involueral bracts ovate or ovate-lanceolate, acuminate-caudate at tip, strongly ciliate; disk brownish-purple. Minn. to Wash. and Calif.—Grown for economic and ornamental purposes. Several hort. forms occur, differing in size of heads, color of rays and in the extent of multiplication of rays in so-called double heads.

7. *H. cucumerifolius*, Torr. & Gray. CUCUMBER-LEAF SUNFLOWER. Ann. with erect mottled sts. 3-6 ft. high, rough above; lvs. alternate, long-petioled, triangular-ovate, 2-4 in. long, acute, serrate, cordate, rough-hairy; heads 2-3 in. across; involueral bracts narrow-lanceolate, acuminate-caudate at tip, scarcely ciliate; disk brownish-purple. Fla. to Tex.—Often included in *H. debilis*, Nutt., but that species is a weaker plant with decumbent not mottled sts. and smaller heads.

8. *H. mollis*, Lam. ASHY SUNFLOWER. Per. 2-5 ft. high, the stout leafy sts. hoary-villous at least when young; lvs. mostly opposite, ovate, 3-5 in. long, cordate and usually clasping, finely toothed, white-pubescent or the upper side scabrous; heads solitary or few, 2-3 in. across; involueral bracts lanceolate, densely pubescent; disk yellowish. Mass. to Ga. and Tex.

9. *H. giganteus*, L. GIANT SUNFLOWER. Stout per. 3-12 ft. high, the rough-hispid sts. branched above; lvs. lanceolate, 3-7 in. long, serrate to nearly entire, rough above and slightly so beneath; heads usually several, somewhat corymbed, mostly long-peduncled, $1\frac{1}{2}$ -3 in. broad; involueral bracts linear or linear-lanceolate, acuminate, ciliate; rays pale yellow; disk yellowish. Wet places, Ont. to N. C. and Colo.

10. *H. Maximilianii*, Schrad. Gray-green per. 3-12 ft. high, with several rough sts.; lvs. lanceolate, 3-7 in. long, conduplicate, serrate or entire, very rough on both sides; heads few together, short-peduncled, 2-3 in. across; involueral bracts linear-lanceolate; ray-fls. deep yellow; disk yellow. (Named after Maximilian Alexander Philip, Prince of Neuwied, traveller in Brazil and N. Amer. early in the 19th century in the interests of natural science.) Minn. to Tex.

11. *H. decapetalus*, L. THINLEAF SUNFLOWER. Per. 2-5 ft. high, the glabrous sts. branched above; lvs. thin, ovate to ovate-lanceolate, 3-8 in. long, serrate, with narrowly margined petioles, roughish above, pubescent beneath; heads numerous, 2-3 in. across; involueral bracts linear-lanceolate, ciliate; rays light yellow; disk yellow. Que. to Ga. and Tenn.

12. *H. tuberosus*, L. GIRASOLE. Per. cult. for the tubers produced on the ends and branches of underground sts. or rootstocks as well as midway on the rootstocks; sts. erect, 5-10 ft. high, rough-hispid; lvs. opposite or the upper alternate, long-ovate to ovate-oblong, 4-8 in. long, serrate-dentate, abruptly contracted into winged petioles, rough above, pubescent beneath; heads 2-3½ in. across, few or many, terminating the branches; involueral bracts lanceolate or linear-lanceolate, spreading; ray-fls. light yellow; disk yellow. N. S. to Fla. and Tex.—Cult. under the meaningless name "Jerusalem artichoke." In improved strains the terminal tubers are club-shaped, 4 in. long, 2-3 in. diam. at the end, and weigh 3-4 ozs.; they constitute an excellent and neglected source of food.

13. *H. lætiflorus*, Pers. SHOWY SUNFLOWER. Per. 4-8 ft. high, sts. leafy and rough but shining; lvs. ovate-lanceolate, 4-10 in. long, slightly serrate, gradually narrowed and decurrent on petioles, rough on both sides, shining; heads several, 2-4 in. across, short-peduncled; ray-fls. deep yellow; disk yellow. Ill. to Ga. and Mo.

28. *SPILANTHES*, Jacq. Usually spreading or creeping herbs, about 60 species, widely distributed in warm parts of both hemispheres.—Lvs. opposite, serrate; heads on peduncles terminating the st. and branches; involueral bracts in about 2 series, loosely appressed; receptacle convex or elongated, with chaffy bracts; ray-

fls. pistillate, yellow or whitish or none; disk-fls. yellow, bisexual and fertile: pappus of awns. (Spilan-thes: Greek for *spot-flower*, in reference to the markings on the disk in some species.)

S. oleracea, L. Sparsely pubescent, diffusely branched: lvs. petiolate, blade broadly ovate, $1\frac{1}{2}$ -3 in. long, repand-subdentate: heads discoid, solitary, Aug.-Oct.; involucre bracts oblong, equal; disk greenish-yellow, ovoid or conical, becoming nearly 1 in. long. Tropics; cultigen.—Rarely cult. for its pungent flavor in salads, also to a slight extent as an ornamental on account of its odd cylinder-like heads.

29. **BIDENS**, L. BUR-MARIGOLD. STICK-TIGHTS. TICKSEED. Weedy plants, more than 200 species widely distributed but mostly American, little known in cult.—Ann. or per. herbs: lvs. opposite, serrate or incised, or often pinnately or ternately divided: heads solitary or clustered, with or without rays; involucre bracts in 2 series, the outer green and more or less foliaceous, the inner thinner and differing in texture; rays yellow or white, neutral; disk-fls. bisexual and fertile, yellow: achenes flat or angled; pappus of 2–4 stiff bristles or awns, usually retrorsely barbed. (*Bidens*: Latin *two teeth*, in reference to the pappus awns.)

- A. Habit erect: heads in corymbs. 1. *B. ferulæfolia*
 AA. Habit procumbent: heads solitary. 2. *B. triplinervia* var.

1. **B. ferulaefolia**, DC. (*Coreopsis ferulaefolia*, Jacq.). *macrantha*
Ann. or bien, with nearly erect
branches 1-3 ft. high, glabrous or slightly pubescent; lvs. bipinnately dissected into small
narrow divisions; heads loosely corymbose, slender-peduncled, $\frac{3}{4}$ -1½ in. across; rays and
disk bright yellow; achenes linear, flattened; pappus of 2 short awns with a few minute
retorse prickles. S. Ariz. to Guatemala.

2. *B. triplinervia*, HBK., var. *macrantha*, Sherff (*B. humilis*, HBK. *B. humilis* var. *macrantha*, Wedd.). Diffuse per. with procumbent or ascending sts. to 1 ft. long: lvs. irregularly bipinnate into linear divisions: heads solitary on long peduncles, 1-2 in. across; rays and disk yellow: achenes linear, 4-angled; pappus of 2-3 awns with retrorse prickles. S. Mex. to Ecuador.

30. **COSMOS**, Cav. Showy herbs, some cult. for ornament; over 25 species, all trop. American, mostly Mexican.—Late-flowering annuals or perennials, often tall: lvs. opposite, entire or lobed or mostly pinnately cut: heads long-peduncled, solitary or in loose corymbose panicles; involucre bracts in 2 series, connate at base; receptacle flat, chaffy; rays showy, variously colored, neutral; disk-fls. bisexual and fertile: achenes linear, commonly beaked, the beak terminating in 2-4 retrorsely barbed awns. (Cos-mos: from a Greek word with a root idea of orderliness; hence an ornament or beautiful thing.)

- A. Division of lvs. linear to filiform.....1. *C. bipinnatus*
 AA. Division of lvs. lanceolate or broader.
 B. Color of fls. yellow.....2. *C. sulphureus*
 BB. Color of fls. rose or red.
 c. Rays rose or lilac, disk yellow.....3. *C. diversifolius*
 cc. Rays and disk deep red.....4. *C. atrosanguineus*

1. *C. bipinnatus*, Cav. Glabrous or somewhat pubescent ann. 7-10 ft. high: lvs. 2-4 in. long, bipinnately cut into remote linear to filiform entire lobes: heads 2-3 in. across; rays white, pink or crimson, truncate or somewhat toothed; disk yellow: achenes glabrous, $\frac{1}{3}$ - $\frac{1}{2}$ in. long, with an abrupt beak much shorter than body. Mex.—Double- or anemone-fl. forms have disk replaced by petal-like parts.

2. *C. sulphureus*, Cav. YELLOW COSMOS. Pubescent ann. 4-7 ft. high, much-branched: lvs. often 1 ft. or more long, 2-3-pinnately cut into lanceolate to elliptic mucronate lobes, shortly ciliate: heads 2-3 in. across; rays strongly 3-toothed at apex, pale pure or golden-yellow; disk yellow, anthers exserted, black with orange tips: achenes hispid, $\frac{3}{4}$ -1 in. long, including the slender beak. Mex. to Brazil.

3. *C. diversifolius*, Otto (*Bidens dahlloides*, Wats.). Per. with tuberous roots but grown as an ann., 1-3 ft. high, usually glabrous: lvs. simple and spatulate or pinnatisect into 5-7 lanceolate to ovate segms., the terminal largest: heads 2-3 in. across; rays rose or lilac, entire or obscurely toothed; disk yellow: achenes glabrous or rough, $\frac{1}{2}$ -1 in. long, with slender beak. Mex.

4. *C. atrosanguineus*, Ort. (*C. diversifolius* var. *atrosanguineus*, Hook. *Bidens atrosanguinea*, Ort. *Dahlia Zimpanii*, Roetzl.). BLACK COSMOS. Differs from *C. diversifolius* in the somewhat smaller heads, with red disk-fls. and dark velvety-red rays. Mex.

31. **DAHLIA**, Cav. (*Georgina*, Willd.). Some dozen or 15 species are now known from the mts. of Mex. and Guatemala (ours Mexican), strong erect branching plants with tuberous roots, some well known for their large showy heads.—Perennials, but sometimes blooming the first year from seed and treated as annuals although the resulting tubers may be carried over: lvs. opposite, 1-3-odd-pinnate, the pinnæ or segms. usually variously ovate and toothed: heads long-peduncled, with yellow disk and red, purple, pink or white rays; disk-fls. bisexual and fertile; ray-fls. neutral or pistillate; involucre with double series of bracts, the inner thin and scale-like and slightly united at base, the outer smaller and somewhat leafy; receptacle flat or curved, chaffy: achenes oblong or obovate, compressed, the pappus lacking or of 2 obscure teeth. (Dah-lia: Andreas Dahl, a Swedish botanist, pupil of Linnæus, 1751-1789.)—The botany of Dahlia is not yet well understood, and the specific names are tentative. Descriptions of the original species were from domesticated and modified plants, and their application is open to doubt; and the native forms have not been sufficiently collected. The lower lvs. and roots, as well as the fls., are essential to a careful understanding of the species.

- A. The tree dahlias,—the plants tall and tree-form with one or more trunks, somewhat woody.
 B. Heads bell-shaped from the position of the rays, nodding.....1. *D. imperialis*
 BB. Heads flat from the expanding rays, erect.....2. *D. excelsa*
 AA. The bush dahlias,—plants producing many sts., not woody, usually not more than 6 ft.
 B. Lf.-segms. 1-2 in. long, blunt but apiculate.....3. *D. Merckii*
 BB. Lf.-segms. 2 in. or more long, acuminate.
 C. Rays flat (at least in single or prominently rayed forms).
 D. Lfts. rather bluntly or at least coarsely toothed.....4. *D. pinnata*
 DD. Lfts. sharp-serrate.....5. *D. coccinea*
 CC. Rays with margins strongly recurved.....6. *D. Juarezii*

1. ***D. imperialis***, Roehl. **BELL TREE DAHLIA. CANDELABRA DAHLIA.** Sts. few or several, 6-18 ft. tall and trunk-like, mostly not branched, angled: lvs. large, openly 3-pinnate like an aralia, finely pubescent; ultimate lfts. ovate, 1-2 in. long, sharp-pointed, sessile or short-stalked, incurved-serrate; heads standing high above the foliage, nodding, 4-7 in. across, white and more or less tinged red, the rays about 8, thin, long and narrow, prominently pointed and not toothed at apex.

2. ***D. excelsa***, Benth. (*D. arborea*, Hort. *D. arborea*, Regel is a *nomen nudum*). **FLAT TREE DAHLIA.** Sts. usually several, to 20 ft. or more, mostly not branched, woody, glaucous: lvs. very large, often 2½ ft. long and nearly as broad, 2-pinnate; ultimate lfts. many, ovate, acuminate, more or less contracted at base, coarsely-few-toothed, nearly or quite glabrous: heads erect, 4-5 in. across; rays about 8, flat-expanding, purplish or crimson-pink; disk of the anemone type.

3. ***D. Merckii***, Lehm. (*D. glabrata*, Lindl. *D. scapigera* var. *typica* forma *Merckii*, Sherff). **BEDDING DAHLIA.** Diffuse slender wholly glabrous plant, 2-3 ft., with slender tubers: lvs. pinnate and the pinnæ pinnatifid into decurrent segms. 1-2 in. long and nearly as broad, which are nearly blunt but apiculate and only few-toothed or obscurely serrate, making an attractive foliage plant: heads on long wiry sts., 1-2 in. across, the flat short rays nearly blunt and obscurely apiculate, lilac; involucre bracts linear. (Named in compliment to H. J. Merck, Senator in Hamburg.)

4. ***D. pinnata***, Cav. **COMMON or GARDEN DAHLIA.** Sts. glabrous or essentially so, branched, 4 ft.: lvs. 2-pinnate or the upper ones pinnate, the expanded petioles nearly connate, the ultimate pinnæ ovate, crenate-dentate, very green above and grayish beneath, the rachis more or less winged: heads horizontal or somewhat nodding, 2-3 in. across but much larger in developed and double forms; rays 8, fertile, rose-colored (other colors now common), ovate, obscurely 3-toothed at apex; outer involucre bracts 6 or 7 and leafy.—The name *D. rosea* (1794 or 1795) is sometimes used for the common hort. dahlias, now much doubled and modified; but *D. pinnata*, Cav., 1791, the type of the genus, undoubtedly must be employed; Cavanilles made both names and considered that he had two good species; and he says that in *D. pinnata* the lvs. are pinnate while in *D. rosea* they are bipinnate. It has been customary to use the name *D. variabilis* for this group; this name starts as *Georgina variabilis*, Willd., 1806, transferred to Dahlia by Desfontaines in 1829; Willdenow states that the lvs. are pinnate, although the lower pinnæ of the radical lvs. are ternate; but these characters probably have minor significance in the old descriptions since both lf.-forms may occur freely on the same plant. Further investigation with these plants in cult. and in the wild may make considerable change in diagnosis of the group; *D. pinnata* was based on cult. subjects, with many (double) rays.

5. ***D. coccinea***, Cav. Very like no. 4 and perhaps not possible to distinguish in cult. plants: more slender; sts. glaucous: lvs. 2-pinnate, the ultimate pinnæ narrower, ovate-

acuminate and sharply serrate, the foliage not so heavy, rachis little or not at all winged; rays 8 (although originally figured with 9), usually not fertile, scarlet on upper surface and lighter colored beneath; outer involucre bracts 5 and reflexed.

6. **D. Juarezii**, Hort. CACTUS DAHLIA. Like no. 4 in stature and growth: most or all of the many rays with recurved margins and mostly brilliant scarlet; rays irregular in length and overlapping, giving a characteristic appearance to the head. Probably a hybrid, the nearest ancestral form being the 8-rayed *D. Popenovii*, Safford, of Guatemala; the first stock is said to have come from Mex.; the specific name is in compliment to Benito Juarez, Mexican president and patriot.

32. **CHRYSOGONUM**, L. One or two per. herbs in E. N. Amer., sometimes transferred to gardens.—Stoloniferous: lvs. opposite and basal, simple: heads long-peduncled, yellow; involucre bracts in 2 series, the outer large and leafy; receptacle with chaffy bracts; ray-fls. pistillate and fertile; disk-fls. bisexual but sterile: achenes flattened, not winged; pappus a short crown. (*Chrysog-onum*: Greek *golden-knee*.)

C. virginianum, L. GOLDEN-STAR. Pubescent, 3–12 in. high, light green: lvs. triangular-ovate, 1–2 in. long, long-petioled, toothed, truncate or abruptly cuneate at base: heads 1–1½ in. across, Apr.–July. Pa. to Fla. and La.

33. **HELIOPSIS**, Pers. Sunflower-like plants, about 7 species native to N. Amer., several cult. for their showy fls.—Per. herbs or one ann., sts. loosely branched: lvs. opposite, petioled, 3-ribbed, coarsely toothed: heads pedunculate, showy; involucre bracts imbricated in 2 or 3 series; rays with large yellow oblong or linear-oblong ligules, persistent on the achenes; disk-fls. partly inclosed in chaffy bracts of the receptacle, bisexual and fertile: achenes without pappus or with a toothed border. (*Heliop-sis*: Greek *like the sun*.)

A. Plant smooth and glabrous throughout or the lvs. roughish above.....1. *H. helianthoides*
AA. Plant rough throughout with hispid-scabrous hairs.....2. *H. scabra*

1. **H. helianthoides**, Sweet (*Bupthalmum helianthoides*, L. *H. lævis*, Pers.). Coarse per. 3–5 ft. high (dwarfed forms 2–3 ft.), smooth and glabrous throughout or nearly so: lvs. thinish, oblong-ovate or ovate-lanceolate, 3–6 in. long, sometimes roughish above: heads numerous, somewhat corymbed, 1½–2½ in. across; rays broadly linear, 1 in. long: achenes smooth and glabrous, truncate or obscurely 2–4-toothed at summit. Ont. to Fla. and Miss. Var. *Pitcheriana*, Hort. (*H. Pitcheriana*, Hort.), has deeper yellow fls.

2. **H. scabra**, Dunal. Differs from *H. helianthoides* chiefly in being rough throughout with hispid-scabrous hairs: upper lvs. sometimes entire: heads few, often solitary: achenes pubescent on the angles when young; pappus a chaffy crown or sometimes of 2–3 teeth. Me. to N. J. and Ark.—Hort. vars. are: *excelsa*, nearly double chrome-yellow heads; *gratissima*, pale yellow; *incomparabilis*, heads double, 3 in. across, golden-yellow; *zinnia-flora*, double.

34. **ZINNIA**, L. Ann. or per. herbs or subshrubs of N. and S. Amer., chiefly Mex., cult. for their showy fls.; about 15 species.—Lvs. opposite, mostly sessile and entire: heads solitary, showy, terminating the branches, the bright-colored rays long-enduring; the disk in cult. forms nearly or wholly lacking; ray-fls. pistillate and fertile; disk-fls. bisexual and fertile; involucre bracts obtuse, imbricated in several to many series; receptacle becoming conical to cylindric, with chaffy scales, enveloping the fls.: achenes flattened, wingless or nearly so, the pappus when present of erect awns or chaffy teeth. (*Zin-nia*: Johann Gottfried Zinn, 1727–1759, professor of medicine at Goettingen.)

A. Scales of receptacle pectinate-fimbriate at tip: heads 2–4½ in. across.....1. *Z. elegans*
AA. Scales of receptacle entire: heads 1–2 in. across.

B. Lvs. linear-lanceolate.....2. *Z. linearis*

BB. Lvs. oblong to ovate-lanceolate.....3. *Z. angustifolia*

1. **Z. elegans**, Jacq. YOUTH-AND-OLD-AGE. Erect ann. 1–3 ft. high, sts. short-hairy: lvs. sessile, more or less clasping, cordate-ovate to elliptic, 1½–4 in. long and 1–2 in. wide, shortly rough-hispid: heads 2–4½ in. across; chaffy bracts of the receptacle pectinate-fimbriate at tip; rays broad and showy, becoming reflexed, originally purple or lilac but now of nearly every color except blue and green; disk originally yellow or orange but in common double forms nearly or quite absent. Mex.—The plant in cult. as *Z. pumila* is a dwarf form of *Z. elegans*; the true *Z. pumila*, Gray, is a tufted grayish per. with linear lvs. ½ in. or less long and pale yellow or white heads ½ in. across.

2. **Z. linearis**, Benth. Branching ann. to 1 ft.: lvs. linear-lanceolate, 2–3 in. long and

$\frac{1}{8}$ – $\frac{1}{4}$ in. wide: heads $1\frac{1}{2}$ –2 in. across, orange, the rays brighter orange on margins; chaffy bracts of receptacle entire and acute at tip. Mex.

3. *Z. angustifolia*, HBK. (*Z. mexicana*, Vilm. *Z. Haageana*, Regel). Branching ann. 1– $1\frac{1}{2}$ ft. high, sts. short-hairy: lvs. sessile, oblong to ovate-lanceolate, $1\frac{1}{2}$ – $2\frac{1}{2}$ in. long and $\frac{1}{2}$ – $\frac{3}{4}$ in. wide at base: heads 1– $1\frac{1}{2}$ in. across, orange, the disk-fls. darkening with age; chaffy bracts of receptacle entire and acute at tip. Mex.

35. **SANVITALIA**, Lam. American ann. herbs, about 7–8 species, chiefly from Ariz. to Cent. Amer.—Mostly low and branching: lvs. opposite, more or less petioled, commonly entire: heads rather small, solitary, terminating the branchlets; involucrel bracts imbricated in about 3 rows, the outer foliaceous-tipped; ray-fls. white or yellow; disk-fls. brown or purple: disk-achenes more or less compressed, the pappus of 1–2 awns or teeth or none; ray-achenes commonly 3-sided, 3-awned. (Sanvitalia: *Sanvitali*, name of a noble Italian family.)

S. procumbens, Lam. Hairy low-growing ann. with trailing sts. branching and leafy: lvs. ovate, $\frac{1}{2}$ –1 in. long, petiolate: heads summer to late autumn, solitary, about $\frac{3}{4}$ in. across, closely subtended by a pair of leafy bracts; rays yellow; disk-fls. dark purple. Mex.

36. **THELESERMA**, Less. Glabrous herbs or subshrubs of W. N. Amer. and extra-trop. S. Amer., cult. for the fls.; about 10 species.—Lvs. opposite or the upper alternate, 1–2-pinnately parted into linear or filiform segms., or the uppermost simple and linear: heads medium-sized, solitary on long peduncles; involucrel bracts in 2 rows, the inner row campanulate and connate to the middle or higher and with whitish or yellowish margins; rays 8–10, neutral, yellow or brownish, in 1 row; disk-fls. purplish, fertile: achenes glabrous, smooth or tuberculate; pappus of 2 awns or scales. (Thelesperma: Greek wart and seed, the achenes often papillose.)

T. Burridgeanum, Blake (*Cosmidium Burridgeanum*, Regel. *C. Burridgeanum atropurpureum*, VanHoutte. *T. hybridum*, Voss. Probably *Coreopsis atrosanguinea*, Hort.). Branching ann., $1\frac{1}{2}$ ft. high: lvs. 1–2-pinnately divided into filiform lobes: heads $1\frac{1}{4}$ – $1\frac{1}{2}$ in. across, on long slender peduncles, Aug.–Sept.; rays broad, brown-purple with yellow margin; outer involucrel bracts densely hairy.

37. **COREOPSIS**, L. (incl. *Calliopsis* and *Leptosyne*). TICKSEED. An attractive genus of over 100 species native to Amer., trop. Afr. and the Hawaiian Isls., a number cult. in the open garden for their showy fls. blooming in summer and autumn.—Ann. or per. herbs or seldom shrubs: lvs. commonly opposite, entire or variously lobed or dissected: heads usually showy, pedunculate, solitary or loosely panicle; involucrel bracts in 2 distinct series of 8 each, the outer herbaceous and narrower than the inner, all commonly united at base; receptacle flat or convex, chaffy; rays in 1 series, neutral or rarely fertile, yellow, parti-colored or sometimes rose-color; disk-fls. bisexual and usually fertile: achenes flat or becoming incurved, winged or wingless; pappus of 2–4 awns, scales or teeth, or entirely lacking. (Coreopsis: Greek, signifying *bug-like*, from the fr.)

- A. Lf.-blades palmately divided.
 - B. Lvs. petioled: segms. oblong-lanceolate..... 1. *C. tripteris*
 - BB. Lvs. sessile: segms. linear.
 - c. Disk-fls. yellow..... 2. *C. verticillata*
 - cc. Disk-fls. purple-brown..... 3. *C. delphinifolia*
- AA. Lf.-blades pinnately divided or simple.
 - B. Disk-fls. dark or purplish-red.
 - c. Segms. of lvs. usually oblong to ovate: outer involucrel bracts about as long as inner..... 4. *C. basalis*
 - cc. Segms. of lvs. linear to linear-lanceolate: outer involucrel bracts much shorter than inner.
 - d. Achenes wingless..... 5. *C. tinctoria*
 - dd. Achenes narrowly winged..... 6. *C. Atkinsoniana*
 - BB. Disk-fls. yellow.
 - c. Color of rays rose..... 7. *C. rosea*
 - cc. Color of rays yellow.
 - d. Lvs. pinnate into narrow-linear divisions: ray-fls. fertile.
 - e. Heads 2–3 in. across: plant per..... 8. *C. maritima*
 - ee. Heads $\frac{3}{4}$ – $1\frac{1}{4}$ in. across: plant ann..... 9. *C. Stillmanii*
 - dd. Lvs. or lf.-segms. lanceolate or broader: ray-fls. sterile.
 - e. Achenes with thick incurved narrow wings..... 10. *C. auriculata*
 - ee. Achenes with thin spreading wings.
 - f. Sts. leafy only toward base: lvs. mostly simple..... 11. *C. lanceolata*
 - ff. Sts. leafy throughout: lvs. mostly divided..... 12. *C. grandiflora*

1. *C. tripteris*, L. Per. 3-10 ft. high, usually glabrous: lvs. petioled, 2-5 in. long, palmately 3-parted into oblong-lanceolate somewhat revolute segms., upper lvs. commonly simple: heads $1\frac{1}{2}$ -2 in. across, in corymbs, long-peduncled; outer involucre bracts about half as long as inner; rays 7-8, yellow, nearly entire or toothed; disk yellow becoming brown or purplish: achenes oblong-obovate, narrowly winged. Ont. to Ga. and La.

2. *C. verticillata*, L. THREAD-LEAF COREOPSIS. Slender glabrous per. 1-3 ft. high, sparingly branched: lvs. appearing verticillate, sessile, 2-3 in. long, palmately 3-parted, the divisions dissected into linear or filiform segms.: heads 1-2 in. across, few in corymbs, slender-peduncled; outer involucre bracts about as long as inner; rays about 8, deep yellow, entire or minutely toothed; disk yellow: achenes oblong-obovate, narrowly winged. Md. to Fla. and Ala.

3. *C. delphinifolia*, Lam. LARKSPUR COREOPSIS. Nearly glabrous very leafy per. 2-5 ft. high: lvs. sessile, 2-3 in. long, palmately 3-parted into linear segms., the middle segms. again 3-5-divided: heads 1-2 in. across, in corymbs, slender-peduncled; outer involucre bracts about as long as inner; rays about 8, yellow, entire or slightly toothed; disk purple-brown: achenes oblong-obovate, narrowly winged. Va. to Ga. and Ala.

4. *C. basalis*, Blake (*Calliopsis basalis*, Dietr. *Coreopsis Drummondii*, Torr. & Gray. *C. picta*, Hort.). GOLDEN-WAVE. Ann. 1-2 ft. high, pubescent or glabrous: lvs. petioled, pinnately divided, the lobes round-ovate to oblong or in the upper lvs. sometimes linear: heads 1-2 in. across, on long peduncles; outer involucre bracts nearly equalling the inner; rays about 8, yellow, brownish-purple at base, toothed or lobed at apex; disk dark purple: achenes obovate, much incurved, with a thick cartilaginous margin. Tex.

5. *C. tinctoria*, Nutt. (*Calliopsis bicolor*, Reichb. *Calliopsis marmorata*, Hort. *Coreopsis elegans*, Hort.). Glabrous ann. 1-3 ft. high, branching above, rather strict: basal and lower cauline lvs. long-petioled, 2-pinnately divided into linear or linear-lanceolate lobes 2-4 in. long, the upper sessile or wing-petioled and with linear lobes: heads $\frac{3}{4}$ -2 in. across, loosely panicle, on slender peduncles; outer involucre bracts much shorter than inner; rays 7-8, yellow with reddish-brown base, the apex toothed or lobed; disk brownish-purple: achenes linear-oblong, somewhat incurved, wingless. Minn. to La. and Calif. Var. *atropurpurea*, Hook. (*C. nigra*, Hort.), has rays brownish-red throughout.

6. *C. Atkinsoniana*, Dougl. (*Calliopsis Atkinsoniana*, Hook.). Ann. or per. 2-4 ft. high, glabrous: lvs. 1-2-pinnately divided into linear lobes: heads $\frac{3}{4}$ -2 in. across, on slender elongated peduncles; outer involucre bracts much shorter than inner; rays 8, yellow with brown-purple base and 3-4-toothed or -lobed apex; disk purple or brownish: achenes flattened, oblong, narrowly winged. (Named for Wm. Atkinson of Grove End, English hort. architect.) Sask. to Ore. and Ariz.

7. *C. rosea*, Nutt. Glabrous per. $\frac{3}{4}$ -2 ft. high, leafy, from slender creeping rootstocks: lvs. 1-2 in. long, entire and linear, or the lower 2-3-parted and the lobes linear: heads $\frac{3}{4}$ -1 in. across, on short peduncles; outer involucre bracts much shorter than inner; rays about 8, rose-color, coarsely 3-toothed or -lobed; disk yellow: achenes oblong, wingless. N. S. to Ga. Var. *nana*, Hort., is smaller with lilac-rose rays.

8. *C. maritima*, Hook. f. (*Tuckermannia maritima*, Nutt. *Leptosyne maritima*, Gray). SEA-DAHLIA. Per. 1-3 ft. high, with fleshy sts. and roots: lvs. bipinnately divided into narrowly linear lobes: heads $2\frac{1}{2}$ in. or more across, solitary, on peduncles 9-12 in. long terminating the branches, in spring; outer involucre bracts only slightly shorter than inner; rays 14-20, yellow, obscurely toothed, fertile; disk yellow: achenes oblong-obovate, narrowly winged. Coasts, S. Calif.

9. *C. Stillmanii*, Blake (*Leptosyne Stillmanii*, Gray). Glabrous ann. 6-18 in. high, sts. leafy below: lvs. pinnately 3-7-parted into narrow-linear segms.: heads $\frac{3}{4}$ -1 $\frac{1}{4}$ in. across, solitary on long peduncles; outer involucre bracts about equalling inner; rays about 8, yellow, coarsely toothed; disk yellow: achenes orbicular or obovate, with corky somewhat roughened wings. (First collected by Dr. J. D. B. Stillman.) Calif.

10. *C. auriculata*, L. Per. to $1\frac{1}{2}$ ft., leafy at base, with erect or ascending sts., usually pubescent, stoloniferous: lvs. long-petioled, 2-5 in. long, orbicular or ovate, often with 1 or 2 small lobes at base of blade: heads $1\frac{1}{2}$ -2 in. across, solitary on long peduncles; outer and inner involucre bracts about equal; rays about 8, yellow, 3-lobed at apex; disk yellow: achenes oblanceolate or obovate, with thick incurved narrow wings. Va. to Fla. and La.—Often confused with *C. pubescens*, Ell., which differs chiefly in the nearly orbicular achenes with thin spreading wings; plant to 3 ft., erect, more leafy to the top.

11. *C. lanceolata*, L. Glabrous or somewhat hirsute-pubescent per. 1-2 ft. high: lvs. usually in a few pairs or mostly in a tuft near the base, oblong-spatulate or lanceolate or nearly linear, 2-6 in. long, obtuse, entire or rarely with 1-2 small lateral lobes: heads $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. across, on very long peduncles; outer involucre bracts commonly shorter than inner; rays about 8, yellow, 2-3-toothed; disk yellow: achenes orbicular, with thin scarious wings. Mich. to Fla. and New Mex.

12. *C. grandiflora*, Hogg (*C. floribunda*, Hort.). Usually somewhat hairy per. 1-2 ft. high, sts. branching and leafy: basal and some of the lower st.-lvs. lanceolate or spatu-

late, entire; upper or sometimes all the st.-lvs. 3-5-parted into lanceolate or linear obtuse lobes, terminal lobes three to five times as long as wide; heads $1\frac{1}{2}$ - $2\frac{1}{2}$ in. across, long-peduncled; outer involucre bracts nearly equalling inner; rays usually 8, yellow, 3-lobed at apex; disk yellow; achenes orbicular, with broad thin scarious wings. Mo. to Fla. and New Mex.

38. **BACCHARIS**, L. Shrubs or herbs of more than 250 species in the Americas.—Lvs. alternate: heads diœcious, small, in panicles or corymbs, of many white or yellowish disk-fls.; involucre bracts imbricated in several series; receptacle flat, naked; corolla of staminate fls. tubular and 5-lobed, of pistillate fls. filiform: achenes somewhat flattened, ribbed; pappus of long white bristly hairs. (Bac-charis: from ancient Greek name.)

B. halimifolia, L. GROUNDSEL-BUSH. Deciduous much-branched shrub to 12 ft.: lvs. obovate or oblong, 1-3 in. long, acute, short-petioled, coarsely toothed, the upper entire: heads in peduncled clusters forming large panicles in late summer: pappus $\frac{1}{2}$ in. long. Coastal and marsh lands, Mass. to Fla. and Tex.

39. **CALLISTEPHUS**, Cass. (name conserved as against the earlier *Callistemma*, Cass.). A single species, native to Asia, yielding many races of well-known annuals for the fl.-garden.—Erect stiffish herb with alternate lvs. coarsely toothed or incised: heads large, radiate, solitary at the ends of the branches; ray-corollas of various colors, often violet; involucre bracts in many series, the outer herbaceous, the inner membranaceous-scarious: pappus-bristles in 2 rows. (Callis-tephus: Greek for *beautiful crown*, said to be in allusion to character of achene.)

C. chinensis, Nees (*Aster chinensis*, L. *C. hortensis*, Cass.). CHINA ASTER. Erect, hispid-hairy, branching, $\frac{1}{2}$ - $2\frac{1}{2}$ ft. high: lvs. broadly ovate or triangular-ovate, deeply and irregularly toothed, the blade decurrent into a petiole, the upper lvs. becoming spatulate and narrower: heads showy, 1-5 in. and more across, in late summer and fall, terminal, in the wild plant with 1-2 series of pistillate ray-fls. and numerous tubular yellow disk-fls. which are bisexual and fertile; involucre hemispherical, the large outer bracts green and often reflexed: achene compressed. China and Japan.—Under cult. the rays become greatly multiplied and show a wide range of variation in size, shape and color,—violet, purple, blue, rose and white, never a true yellow.

40. **BELLIS**, L. DAISY. Small plants, 10 species in Eu. and the Medit. region, one long cult.—Ann. or per. herbs, cespitose or with branching sts.: lvs. alternate or all basal, entire or sinuate, toothed: heads radiate, solitary, on naked peduncles; involucre bracts herbaceous, in 1-2 series; receptacle naked, conical; rays white or rose-color, in 1 series, pistillate; disk-fls. yellow, bisexual and fertile: achenes flattened, margined; pappus lacking. (Bel-lis: Latin *bellus*, pretty.)

A. Lvs. obovate 1. *B. perennis*
AA. Lvs. ovate or orbicular 2. *B. rotundifolia*

1. **B. perennis**, L. TRUE OR ENGLISH DAISY. Per. 3-6 in. high: lvs. forming a basal tuft, spatulate or obovate, 1-2 in. long, narrowed into margined petioles, slightly toothed, pubescent: heads solitary, 1-2 in. across, on hairy peduncles; involucre bracts oblong, obtuse, hairy; rays numerous, linear, white or rose, in vars. wholly or partly red ("monstrosa") and often incurved or reflexed or quilled. W. Eu.—Grown in fl.-gardens and often escaping to lawns.

2. **B. rotundifolia**, Boiss. & Reut. Differs from *B. perennis* in the ovate to orbicular lvs. $\frac{3}{4}$ - $1\frac{1}{4}$ in. long, on slender petioles 1-3 in. long, sinuate-toothed: heads $\frac{3}{4}$ - $1\frac{1}{4}$ in. across, with fewer broader white rays. Morocco, Algeria. Var. *cærulescens*, Hook., has blue rays.

41. **BELLIUM**, L. A few species of small herbs in the Medit. region, grown in the rock-garden.—Lvs. in basal tufts: heads solitary on long peduncles; involucre bracts in about 2 series; receptacle naked; rays-fls. pistillate, white; disk-fls. yellow, bisexual and fertile: achenes somewhat flattened; pappus in 2 series, of bristles and scales. (Bel-lium: *resembling bellis*.)

A. Plant per., stoloniferous 1. *B. bellidioides*
AA. Plant ann. 2. *B. minutum*

1. **B. bellidioides**, L. Stoloniferous per. 2-5 in. high: lvs. spatulate or rhombic, the blade $\frac{1}{4}$ - $\frac{1}{2}$ in. across, entire, with long pubescent petioles: heads $\frac{1}{2}$ in. or less across, rays white or pinkish.

2. **B. minutum**, L. Ann. 1-3 in. high: lvs. ovate-spatulate, obtuse, entire, long-petioled, glabrous or somewhat hairy: heads about $\frac{1}{4}$ in. across, rays white tipped purplish.

42. **SOLIDAGO, L. GOLDENROD.** Per. herbs blooming in late summer and autumn and sometimes transferred to gardens; over 125 species, mostly in N. Amer.—Lvs. alternate, simple: heads small and few-fl., borne in panicles, thyrses, corymbs or racemes; involucre bracts imbricated in several series; receptacle not chaffy, usually pitted; ray-fls. yellow, in 1 series, pistillate; disk-fls. yellow, bisexual: achenes terete or angled; pappus of bristles in 1 or 2 series. (Solidago: from Greek, to make solid or whole.)

- A. Heads not in one-sided racemes, in clusters forming a corymb or thyrses.
 - B. Plant rough-pubescent, 1-5 ft. high. 1. *S. rigida*
 - BB. Plant glabrous or nearly so, 3-12 in. high. 2. *S. Cutleri*
- AA. Heads in one-sided racemes forming large panicles.
 - B. Lvs. pinnately veined, entire. 3. *S. sempervirens*
 - c. Basal lvs. to 1 ft. long, thick and fleshy. 4. *S. odora*
 - cc. Basal lvs. to 6 in. long, not fleshy. 5. *S. canadensis*
 - BB. Lvs. 3-nerved (the 2 lateral nerves prominent), toothed. 6. *S. nemoralis*
 - c. Plant with long horizontal stolons: lvs. linear-lanceolate, deep green above. 7. *S. canadensis*
 - cc. Plant without horizontal stolons: lvs. oblanceolate or spatulate, gray-pubescent. 8. *S. nemoralis*

1. *S. rigida*, L. Rough-pubescent, 1-5 ft. high: lvs. ovate or oblong, stiff, the upper sessile and clasping and 1-2 in. long, the basal long-petioled and to 1 ft. long, entire or finely toothed, pinnately veined: heads about $\frac{1}{2}$ in. long, in clusters forming dense compound corymbs. Me. to Ga. and Mo.

2. *S. Cutleri*, Fern. (*S. Virgaurea* var. *alpina*, Bigel.). Alpine 3-12 in. high, glabrous or slightly pubescent: lvs. obovate or spatulate, 2-4 in. long, toothed, narrowed into petioles, pinnately veined, st.-lvs. few and sessile: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. long, in short racemes or thyrses. (Named for Manasseh Cutler, 1742-1823, botanist and early explorer of White Mts.) Mts., Me. to N. N. Y.

3. *S. sempervirens*, L. Sts. leafy, 2-8 ft. high, glabrous below the infl.: lvs. thick and fleshy, oblong or lanceolate, the lower long-petioled and to 1 ft. long, entire, with several pairs of lateral veins, upper lvs. sessile: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. long, in one-sided racemes forming large narrow often leafy panicles. N. S. to Fla. and Mex., along coast.

4. *S. odora*, Ait. Sts. simple, 2-4 ft. high, pubescent in lines: lvs. lanceolate or linear-lanceolate, 2-6 in. long, entire, pinnately veined, sessile or the lower petioled, often aniscented: heads about $\frac{1}{2}$ in. long, in one-sided spreading racemes forming large panicles. Me. to Fla. and Tex.

5. *S. canadensis*, L. Plant with long horizontal stolons, 1-5 ft. high, glabrous or pubescent: lvs. linear-lanceolate, 2-5 in. long, 3-nerved, with remote sharp teeth, narrowed at base, sessile or lower lvs. petioled, deep green above: heads $\frac{1}{2}$ - $\frac{1}{2}$ in. long, in one-sided spreading or recurved racemes forming large panicles. Newf. to S. C. and Tex.

6. *S. nemoralis*, Ait. Grayish-green pubescent plant 1-2 ft. high: lvs. thick, oblanceolate or spatulate, 3-6 in. long, 3-nerved, crenate-dentate or upper entire, petioled: heads $\frac{1}{6}$ - $\frac{1}{4}$ in. long, in one-sided spreading or recurved racemes forming usually one-sided panicles. N. S. to Fla. and Tex.

43. **CHRYSOPSIS**, Nutt. GOLDEN ASTER. Herbs of about 20 N. American species, sometimes transferred to gardens.—Lvs. alternate, entire, sessile or lower petioled: heads many-fl., in loose corymbs or sometimes solitary; involucre bracts imbricated in several series; receptacle flat, not chaffy, usually pitted; ray-fls. yellow, pistillate; disk-fls. yellow, mostly bisexual: achenes flattened, pubescent; pappus of 2 series, the inner of bristles, the outer of smaller bristles or scales. (Chrysopsis: Greek resembling gold.)

- A. Lvs. linear: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. across. 1. *C. falcata*
- AA. Lvs. oblong or lanceolate: heads $\frac{3}{4}$ -1 in. across. 2. *C. mariana*
- BB. Bracts of involucre glandular: peduncles long. 3. *C. villosa*
- BB. Bracts of involucre not glandular: peduncles short. 4. *C. villosa*

1. *C. falcata*, Ell. (*Inula falcata*, Pursh). Very leafy per. to 1 ft., woolly-pubescent when young: lvs. stiff, linear, 1-4 in. long: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. across, few on slender pedicels, in corymbs; involucre bracts slightly pubescent. Mass. to N. J.

2. *C. mariana*, Ell. (*Inula mariana*, L.). Per. 1-2½ ft. high, loosely pubescent or becoming nearly glabrous: lvs. oblong or spatulate to lanceolate, 1-5 in. long: heads $\frac{3}{4}$ -1 in. across, many on long glandular peduncles, in corymbose panicles; involucre bracts glandular, sticky-pubescent. S. N. Y. to Fla. and La.

3. *C. villosa*, Nutt. (*Amellus villosus*, Pursh). Per. 1-2 ft. high, pubescent: lvs. oblong or lanceolate, 1-2 in. long, the pubescence appressed: heads about 1 in. across, few on short peduncles, in corymbs; involucre bracts pubescent and sometimes ciliate. Minn. to B. C. and New Mex.

44. **XANTHISMA**, DC. One ann. or bien. herb in Tex., planted in the fl.-garden.—Lvs. alternate: heads solitary at end of branches; involucre bracts imbricated in many series; receptacle flat, pitted and somewhat fimbriate; rays yellow, in 1 series; disk-fls. yellow, bisexual and fertile: achenes angled; pappus of stiff bristles. (*Xanthisma*: Greek *dyed yellow*.)

X. texanum, DC. (*Centaureidium Drummondii*, Torr. & Gray). STAR-OF-TEXAS. Branching, nearly glabrous, 1-4 ft. high: lvs. oblong to lanceolate, to $2\frac{1}{2}$ in. long, entire or toothed, the lower sometimes pinnatifid: heads 1-2 in. across; involucre bracts with whitish margins.

45. **BRACHYCOME**, Cass. About 50 species, mostly natives of Australia, one grown in the fl.-garden.—Ann. or per. herbs with simple or branching sts.: lvs. basal or alternate, entire to pinnatifid: heads solitary and pedunculate or loosely corymbose at the ends of the branches; receptacle without scales; involucre broad, the bracts in about 2 series and with dry scarious margins; rays in 1-2 series, white, blue or lilac, pistillate; disk-fls. yellow, bisexual: achenes flattened, angled or winged; pappus of bristles or scales or lacking. (*Brachycome*: Greek *short hair*, alluding to the pappus.)

B. ibridifolia, Benth. SWAN RIVER DAISY. Branching ann. 6-18 in. high: lvs. alternate, small, pinnately divided into narrow segms.: heads 1 in. across, on slender peduncles, the rays blue, rose-color or white. Australia.

46. **OLEARIA**, Moench. TREE ASTER. DAISY-BUSH. Small evergreen trees or shrubs sometimes planted in Calif.; over 125 species, mostly in New Zeal. and Australia.—Lvs. usually alternate, white or yellowish-tomentose beneath: heads solitary or in corymbs or panicles; involucre bracts imbricated in several series, margins dry or scarious; receptacle flat or convex, pitted; ray-fls. white, blue or purple, in 1 series, pistillate; disk-fls. bisexual: achenes terete or slightly flattened; pappus of several rows of bristles. (*Olearia*: believed to refer to the resemblance to *Olea*.)

O. Haastii, Hook. f. Shrub 4-10 ft. high, much-branched: lvs. crowded, oblong or ovate, $\frac{1}{2}$ - $1\frac{1}{4}$ in. long, entire, obtuse, short-petioled, shining dark green above, white-tomentose beneath: heads about $\frac{1}{2}$ in. across, in long-peduncled corymbs 2-3 in. across; rays 3-5, white; disk yellow. (Named for Sir Johann Franz Julius von Haast, 1824-1887, geologist and explorer.) New Zeal.

47. **CHARIEIS**, Cass. One species, in the western Cape region of S. Afr., occasionally cult. in gardens.—Ann. herb, diffuse or branched at base, hairy: lower lvs. opposite, the upper alternate, all entire or nearly so: heads solitary; involucre broad, the bracts in 1 series; receptacle flat, naked; ray-fls. pistillate; disk-fls. bisexual: achenes flattened, margined; pappus of plumose bristles. (*Charieis*: Greek *elegant*, from the pleasing fls.)

C. heterophylla, Cass. (*C. Neesii*, Hort. *Kaulfussia amelloides*, Nees). Small branchy hairy plant 6-12 in. high: lvs. oblong-spatulate or oblong-lanceolate, to $2\frac{1}{2}$ in. long: heads about $\frac{3}{4}$ in. across, long-pedunculate; rays blue (violet or red-violet in vars.); disk yellow or blue.

48. **BOLTONIA**, L'Her. Tall per. herbs, 4 or 5 species native to the U. S. and E. Asia, sometimes planted in borders and wild gardens, flowering in late summer and fall.—Glabrous, erect, leafy-stemmed, branching above: lvs. alternate, entire or minutely toothed, sessile and commonly becoming vertical by a twist at base, rarely decurrent: heads usually in panicles, short-peduncled, rather showy, the numerous rays white, purplish or violet; involucre bracts imbricated in few series, scarious-margined; disk-fls. bisexual: achenes flattened, with thick or winged margins; pappus of scales with a few stiff bristles. (*Boltonia*: James Bolton, English botanist, who wrote 1775-1795.)

A. Involucre bracts lanceolate, acute: heads $\frac{3}{4}$ in. across 1. *B. asteroides*
AA. Involucre bracts oblong to ovate, obtuse or mucronate: heads 1 in. across 2. *B. latissquama*

1. **B. asteroides**, L'Her. (*Matricaria asteroides*, L. *B. glastifolia*, L'Her.). Sts. 2-8 ft. high: lvs. broadly lanceolate or the upper narrower, 2-5 in. long, minutely serrulate: heads $\frac{3}{4}$ in. across; involucre bracts lanceolate, acute; rays white to violet and purple: pappus-scales numerous, conspicuous, the bristles sometimes lacking. Conn. to Fla. and La.

2. **B. latisquama**, Gray. Heads larger, 1 in. or more across; involucre bracts oblong to ovate, obtuse or mucronate; rays blue-violet; pappus-scales small, the bristles present and conspicuous. Mo. to Okla. Var. **nana**, Hort., is 2-3 ft. tall with pinkish rays.

49. **HETEROPAPPUS**, Less. Per. herbs, about 4 Asiatic species, one planted in the fl.-garden.—Lvs. alternate, entire or coarsely toothed: heads solitary or loosely paniced; involucre bracts imbricated in many series; receptacle flat or convex, naked or pitted; ray-fls. blue or white, pistillate, in 1 series; disk-fls. bisexual and fertile: achenes flattened; pappus of short and long chaffy bristles. (Heteropappus: Greek *two kinds of pappus*.)

H. hispidus, Less. (*Aster hispidus*, Thunb.). Sts. rough, 2 ft. and more high: basal lvs. broadly spatulate to lanceolate, often coarsely toothed; st.-lvs. linear, acute: heads to $1\frac{1}{4}$ in. across; rays blue; disk-fls. yellow. Japan, Mongolia.

50. **ERIGERON**, L. FLEABANE. About 150 species scattered over the world, particularly in temp. and mountainous regions, a number cult. as border plants.—Annuals or perennials, acaulescent, or with erect loosely or corymbosely branched sts.: lvs. entire, toothed, or rarely dissected, those of the st. alternate: heads radiate (in ours), solitary or clustered; involucre campanulate or hemispheric, the bracts narrow, nearly equal, in 1-2 series; rays in 2 or more series, mostly rose, violet or purple, rarely cream-colored or white and in one species orange: achenes flattened; pappus of soft bristles. (Erigeron: Greek *old man in spring*; some of the early kinds are somewhat hoary.)

- A. Color of ray-fls. orange-yellow..... 1. *E. aurantiacus*
- AA. Color of ray-fls. white, violet or purple.....

- KK. Rays usually white; involucre hirsute; lvs. often dentate..... 13. *E. Coulteri*

1. **E. aurantiacus**, Regel. DOUBLE ORANGE DAISY. More or less velvety; sts. leafy, 6-10 in. high, usually several from a tuft of basal lvs., these and the lower st.-lvs. spatulate-oblong or elliptic-oblong, more or less twisted; upper st.-lvs. ovate and sessile or clasping: heads usually solitary, about 1 in. across; involucre bracts loose, reflexed, pubescent; rays orange-yellow, linear, in 5-6 rows with series of tubular pistillate fls. between ray- and disk-fls.: pappus simple. Turkestan.

2. **E. compositus**, Pursh. Per. with scape-like sts. 2-8 in. high; lvs. crowded at base of st., 2-3-ternate into linear or spatulate segms., long-petioled, $\frac{1}{2}$ -3 in. long, hirsute: heads solitary, about $\frac{3}{4}$ in. across; involucre hirsute and glandular; rays 40-60, white or purplish, to $\frac{1}{2}$ in. long: pappus simple. Alaska to Calif. and Rocky Mts. Var. **discoideus**, Gray (var. **trifidus**, Gray. *E. trifidus*, Hook.), is smaller, with heads about $\frac{1}{2}$ in. across, lvs. prevailingly 1-ternate.

3. **E. Karvinskianus**, DC. (*E. mucronatus*, DC. *Vittadinia triloba*, Hort. not DC.). Much-branched per. but blooming first year from seed, to 18 in., some or all the branches decumbent and more or less trailing: lower st.-lvs. obovate-cuneate, to 1 in. long, ciliate at base, otherwise glabrous, often 3-5-toothed at apex, the teeth coarse, obtuse and mucronate; upper lvs. oblong, subentire: heads on solitary peduncles, to $\frac{3}{4}$ in. across; rays numerous, twice as long as the disk-fls., in 2 series, white with purple back; involucre slightly hirsute; pappus double. (Named for Baron v. Karwinski, page 46.) Mex. to Panama.

4. *E. alpinus*, L. (*Trimorpha alpina*, Vierhapper). Per. 1-12 in. high; basal lvs. obovate or spatulate, $\frac{1}{2}$ -5 in. long, hairy on both sides and ciliate, st.-lvs. lanceolate to linear: heads solitary or several, $\frac{3}{4}$ -1 in. across; involucre hirsute; rays 60-150, rose or purple, to $\frac{1}{4}$ in. long, with rayless narrow-tubular pistillate fls. between ray- and disk-fls., the latter yellow with purple tips. N. Eu., N. Asia.

5. *E. multiradiatus*, Benth. HIMALAYAN FLEABANE. Per. 1-2 ft. high, hairy: lvs. obovate or lanceolate, $1\frac{1}{2}$ -3 in. long, entire or with few coarse teeth: heads solitary or few on long peduncles, 2-3 in. across; involucre densely hirsute; rays very numerous, purple, to $\frac{3}{4}$ in. long; pappus double, red. Himalayas.

6. *E. pulchellus*, Michx. POOR ROBINS PLANTAIN. Per. 1-2 ft. high, producing stolons and offsets, hairy: basal lvs. tufted, spatulate, 1-6 in. long, short-petioled, toothed, st.-lvs. sessile and usually entire: heads 1-6 on slender peduncles, 1- $1\frac{1}{2}$ in. across; involucre pubescent; rays 50-65, violet or bluish-purple, $\frac{1}{3}$ - $\frac{1}{2}$ in. long; pappus simple. N. S. to Ga. and Tex.

7. *E. divergens*, Torr. & Gray. Diffuse ann. or bien. 6-12 in. high, densely gray-pubescent throughout: lower lvs. spatulate or oblanceolate, 1-2 in. long, entire or cut-toothed, upper lvs. smaller: heads usually numerous, solitary or in corymbs, $\frac{3}{4}$ -1 in. across; rays to 100, filiform, violet to nearly white, to $\frac{1}{2}$ in. long; pappus double. B. C. to Mex. and Neb.

8. *E. speciosus*, DC. (*Stenactis speciosa*, Lindl.). Erect per. $1\frac{1}{2}$ -2 ft. high, sts. more or less woody below, leafy, branching and sparsely hairy above: lvs. entire, short-ciliate, glabrous, those of the st. lanceolate, acuminate, somewhat clasping, the basal ones spatulate, 3-6 in. long, petioled: heads 1- $1\frac{1}{2}$ in. across, borne at the tips of the corymbosely clustered branchlets; involucre hirsute and slightly glandular; rays very numerous, dark violet or lavender, about $\frac{1}{2}$ in. long; pappus double. B. C. to W. Ore. and Lower Calif. Var. *macranthus*, Cronquist (*E. macranthus*, Nutt.), has glandular but not hirsute involucre.—The plant grown as *E. caucasicus* seems to belong here; the true *E. caucasicus*, Steven, has cordate-ovate clasping st.-lvs., hairy sts. with few heads; Caucasus.

9. *E. callianthemus*, Greene (*E. salsuginosus*, Gray not *Aster salsuginosus*, Richardson). Per. 6-18 in. high, slightly pubescent: lower lvs. oblanceolate, petioled, 2-5 in. long, glabrous except the ciliate margins, upper lvs. smaller and sessile; involucre glandular; rays 35-65, purple or violet, broad-linear, to $\frac{1}{2}$ in. long; pappus simple. B. C. to Calif. and New Mex.

10. *E. glaucus*, Ker. BEACH ASTER. SEASIDE DAISY. More or less pubescent per. 9-12 in. high, the rather fleshy crown bearing a tuft of basal lvs. and several leafy simple 1-headed or occasionally branching sts.: lvs. commonly entire, slightly glaucous or often green in cult., spatulate or the upper oblong: heads $1\frac{1}{4}$ - $1\frac{1}{2}$ in. across; involucre hirsute; rays 70-90, bright violet, $\frac{1}{4}$ - $\frac{1}{2}$ in. long; pappus double. Ore. to Calif., along coasts.

11. *E. glabellus*, Nutt. (*E. asper*, Nutt.). More or less pubescent per. 6-20 in. high, the leafy sts. usually bearing 1-3 heads: upper lvs. lanceolate, becoming small and bract-like in the flowering branches; lower lvs. oblanceolate or spatulate, 2-4 in. long; heads 1-2 in. across; involucre bristly or pubescent; rays 100-150, violet, purple or rarely white, $\frac{1}{3}$ - $\frac{1}{2}$ in. long; pappus double. Alaska to Wis.

12. *E. elatior*, Greene (*E. grandiflorus* var. *elatior*, Gray). Per. 1-2 ft. high, hairy: lvs. ovate-lanceolate to lanceolate, 1-2 in. long, entire: heads 1-3, 1- $1\frac{1}{2}$ in. across; involucre densely woolly; rays numerous, lilac or purple, about $\frac{1}{2}$ in. long; pappus simple. Colo. to Utah.

13. *E. Coulteri*, Porter. Slender equally leafy per. 10-20 in. high: lvs. more or less pubescent, the lower obovate to oblong, 2-6 in. long, entire or serrate; upper lvs. ovate to lanceolate: heads solitary (rarely 2 or 3), the 50-70 rays $\frac{1}{2}$ in. or more long, white varying to purplish; involucre hirsute: pappus simple. (For Thos. Coulter, page 110.) Rocky Mts. to Calif. and Wash.

51. **ASTER, L. ASTER. STARWORT. MICHAELMAS DAISY.** A large temp. zone genus of more than 600 species particularly abundant in N. Amer., a number in cult. as border plants for autumn or summer bloom.—Leafy-stemmed herbs, mostly per. and occasionally somewhat woody at base, very rarely ann.: lvs. always alternate: heads usually clustered, sometimes solitary, seldom small; involucre bracts commonly unequal and in part herbaceous, imbricated in several or few series, sometimes subequal and little imbricated; receptacle flat or convex, pitted; rays numerous in 1-2 series, flattish, white, blue, red or purple; disk-fls. yellow, in several species changing to purple or rose-color: achenes nerved, mostly compressed, the pappus-bristles copious in 1-2 series. (As-ter: Latin *star*.)—For the aster of fl.-gardens, see Callistephus.

- A. Lvs. pinnatifid. 1. *A. tanacetifolius*
 AA. Lvs. simple.
 B. Sts. simple and scape-like, 1-headed.
 C. Plant stoloniferous: pappus-bristles much shorter than florets. 2. *A. tongolensis*
 CC. Plant not stoloniferous: pappus-bristles about length of florets.
 D. Pappus simple: plant less than 1 ft. high. 3. *A. alpinus*
 DD. Pappus of 2 series, the outer very short: plant 1½-3 ft. high.
 E. Disk-fls. reddish-orange with purple tip. 4. *A. diplostephioides*
 EE. Disk-fls. yellow.
 F. Shape of lvs. linear to linear-lanceolate. 5. *A. Farreri*
 FF. Shape of lvs. lanceolate to obovate. 6. *A. yunnanensis*
 BB. Sts. usually branched and several- to many-headed.
 C. Plant a shrub with wand-like branches bearing many short lateral twigs with a solitary head. 7. *A. fruticosus*
 CC. Plant an herb with spreading branches.
 D. Shape of lvs. cordate-ovate. 8. *A. cordifolius*
 DD. Shape of lvs. not cordate-ovate.
 E. Base of upper lvs. clasping.
 F. Foliage smooth and glabrous.
 G. Bracts of involucre closely appressed: st. glabrous. 9. *A. laevis*
 GG. Bracts of involucre somewhat spreading: st. slightly pubescent. 10. *A. novi-belgii*
 FF. Foliage pubescent or rough.
 G. Bracts of involucre pubescent and viscid. 11. *A. novæ-angliæ*
 GG. Bracts of involucre glabrous or ciliate. 12. *A. puniceus*
 EE. Base of lvs. not clasping.
 F. Width of lvs., at least some of them, ½ in. or more, lanceolate to oblong or oval.
 G. Heads ½-¾ in. across, rays white. 13. *A. umbellatus*
 GG. Heads 1-2 in. across, rays violet or blue.
 H. Basal lvs. to 2 ft. long, coarsely toothed. 14. *A. tataricus*
 HH. Basal lvs. to 5 in. long, entire or slightly toothed.
 I. Bracts of involucre glandular-viscid. 15. *A. spectabilis*
 II. Bracts of involucre hairy but not glandular. 16. *A. Amellus*
 FF. Width of lvs. ¼ in. or less, linear or linear-lanceolate.
 G. Foliage strongly punctate-dotted. 17. *A. sedifolius*
 GG. Foliage not punctate.
 H. Ray-fls. 1 in. long. 18. *A. grandiflorus*
 HH. Ray-fls. ½ in. or less long.
 I. Under surface of lvs. glabrous.
 J. Rays violet. 19. *A. linariifolius*
 JJ. Rays white. 20. *A. ptarmicoides*
 II. Under surface of lvs. pubescent.
 J. Bracts of involucre with obtuse or mucronate spreading tips: lvs. ½-1 in. long. 21. *A. ericoides*
 JJ. Bracts of involucre with acuminate appressed tips: lvs. 1-3 in. long. 22. *A. pilosus*
1. *A. tanacetifolius*, HBK. (*Machæranthera tanacetifolia*, Nees). TAHOKA DAISY. Bien. or ann. 1-2 ft. high, branched from base, glandular-pubescent: lvs. 1-2 in. long, 2-3 pinnatifid into linear-oblong bristle-tipped segms.: heads numerous, 1-2 in. across; involucre bracts with whitish base and linear-subulate spreading green tips; rays blue-violet, ½-¾ in. long; disk yellow. S. D. to Tex. and Mex.
2. *A. tongolensis*, Franch. (*A. subcæruleus*, S. Moore). Erect hairy stoloniferous per. 4-12 in. high, from a tuft of oblong-spatulate entire petioled lvs. 2-5 in. long; st.-lvs. oblong-lanceolate, sessile: heads terminating the main st. 1½-2 in. across, in June; involucre bracts oblong, obtuse, hairy; rays pale blue, ½-¾ in. long; disk yellow: pappus much shorter than florets. W. China to India.
3. *A. alpinus*, L. Appressed-pubescent per., the simple leafy sts. 6-12 in. high, several from base: lvs. entire, the basal and lower cauline spatulate or oblong-spatulate, tapering to a winged petiole and 2-3 in. long, the upper cauline linear-lanceolate, sessile: heads solitary at the ends of the st., 1½ in. across, May-June; involucre bracts nearly equal, lanceolate, ciliate; rays blue or violet (white in var. *albus* and rosy-purple in *ruber*), about ¾ in. long; disk-fls. yellow, becoming almost purple: pappus simple, about length of florets. Rocky Mts. and mts. of Eu.
4. *A. diplostephioides*, Clarke (*Heterochaeta diplostephioides*, DC.). Erect hairy glandular per. to 3 ft.: lvs. lanceolate, to 4 in. long and 1 in. wide, entire or few-toothed, the lower petioled, st.-lvs. sessile: heads solitary, to 3 in. across; involucre bracts triangular, acute; rays violet or blue, 1 in. or more long; disk-fls. reddish-orange with purple tips: pappus of 2 series, the outer very short. Himalayas.
5. *A. Farreri*, W. W. Smith & Jeffrey. Similar to *A. diplostephioides* but lvs. narrower, linear to linear-lanceolate, the lower 4-6 in. long and about ½ in. wide; disk-fls. yellow. (Collected by R. J. Farrer.) China.
6. *A. yunnanensis*, Franch. (*A. diplostephioides* var. *yunnanensis*, Onno). Distinguished from *A. Farreri* by the broader obovate lvs., the basal deciduous. W. China.
7. *A. fruticosus*, L. (*Diplopappus fruticosus*, Less.). Shrub 2-4 ft. high, with wand-like branches bearing many short lateral twigs with a solitary head on peduncles 1-3 in. long:

lvs. linear, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, margins entire and recurved, punctate, 1-nerved, attenuate at base, glabrous and glandular: heads 1 in. across; involucre bracts glabrous, tipped with an oblong gland; rays purple. S. Afr.

8. *A. cordifolius*, L. BLUE WOOD ASTER. Much-branched per. 1–5 ft. high, sts. usually glabrous: lvs. ovate-cordate, the lower long-petioled and 2–5 in. long, toothed, slightly pubescent: heads numerous, $\frac{1}{2}$ – $\frac{3}{4}$ in. across; involucre bracts appressed, linear, glabrous; rays violet or blue, $\frac{1}{4}$ in. long. N. B. to Ga. and Miss.

9. *A. lævis*, L. Stoutish per. 2–3 ft. high, branching above, glabrous below the infl., often glaucous: lvs. ovate or oblong to lanceolate, ciliate-serrulate and often toothed, the basal and lowest cauline 4–5 in. long, narrowed at base to a winged petiole, the upper with auriculate or subcordate and partly clasping base: heads about 1 in. across, paniced, numerous, crowded, on rather stout leafy-bracteate peduncles; involucre bracts herbaceous-tipped, closely appressed; rays blue or violet. Me. to Ga. and La.—Source of cultivars; grown also in gardens in the tropics.

10. *A. novi-belgii*, L. NEW YORK ASTER. Per. 1–3 ft. high, smooth and glabrous or slightly pubescent above: lvs. oblong to linear-lanceolate, 2–6 in. long, entire or serrate, the upper sessile and partly clasping; heads crowded, paniced, about 1 in. across; involucre bracts linear, acute, with herbaceous tips, somewhat spreading; rays bright blue-violet, $\frac{1}{2}$ in. long. Newf. to Ga.—Runs into many named cultivars, largely of European origin.

11. *A. novæ-angliæ*, L. NEW ENGLAND ASTER. Per. with stout strict sts. 3–5 ft. high, branching above and very leafy to the top, coarsely hirsute or hispid with jointed hairs, also with glandular pubescence: lvs. lanceolate to broadly linear, 2–5 in. long, entire, half-clasping by a strongly auriculate-cordate base, pubescent: heads crowded, 1–2 in. across; involucre bracts linear-subulate, glandular-viscid and pubescent; rays deep purple, $\frac{1}{2}$ – $\frac{3}{4}$ in. long. Que. to S. C. and Colo. Var. *roseus*, DC., has rose-colored rays.

12. *A. puniceus*, L. Per. 3–8 ft. high, with reddish hairy sts.: lvs. lanceolate or oblong-lanceolate, 3–6 in. long, toothed or entire, base broad or narrow and clasping, rough above, pubescent on midrib beneath: heads numerous, 1–1½ in. across; involucre bracts linear or oblong, glabrous or ciliate; rays violet-purple or rarely white, about $\frac{1}{2}$ in. long. Swamps, Newf. to Ga. and Ala.

13. *A. umbellatus*, Mill. (*Doellingeria umbellata*, Nees). Per. 1–8 ft. high, branched at top: lvs. lanceolate or oblong-lanceolate, 5–6 in. long and $\frac{1}{2}$ –1 in. wide, entire, short-petioled or upper sessile, glabrous above and slightly pubescent beneath: heads $\frac{1}{2}$ – $\frac{3}{4}$ in. across, the infl. flat-topped; involucre bracts lanceolate, pubescent or ciliate; rays white, about $\frac{1}{2}$ in. long. Newf. to Ga. and Iowa.

14. *A. tataricus*, L. f. Per. to 7 ft., sts. erect and hispid, corymbose at summit: lvs. large, the basal 2 ft. long and 6 in. wide, lanceolate or ovate-lanceolate, attenuate at base, coarsely toothed; st.-lvs. sessile, to 6 in. long and 1 in. wide: heads 1 in. or more across; involucre bracts purplish at tip; rays blue or purple, $\frac{3}{4}$ in. long; disk yellow. Siberia, Japan, China.

15. *A. spectabilis*, Ait. Per. 1–2 ft. high, sts. simple or branched above, pubescent and somewhat glandular: lower lvs. oval, 3–5 in. long and 1–1½ in. wide, petioled, slightly toothed; upper st.-lvs. linear-oblong, sessile, nearly entire: heads about 1½ in. across, in corymbs; involucre bracts linear-oblong, glandular-viscid, tips spreading; rays bright violet, $\frac{1}{2}$ – $\frac{3}{4}$ in. long. Mass. to N. C.

16. *A. amellus*, L. ITALIAN ASTER. Roughish short-hispid per. 1–2 ft. high, sts. commonly corymbosely branched above: lvs. oblong to oblong-lanceolate, obtuse and apiculate or acute, entire or nearly so, narrowed to a sessile base, the lower to 5 in. long and 1 in. wide: heads 1–1¼ in. across; involucre bracts oblong, obtuse, hairy; rays broad, purple, $\frac{3}{4}$ in. long; disk yellow. (Amellus: from the river Mella in Mantua where this plant occurs.) Eu., Asia. Var. *elegans*, Hort., is lower and free-flowering.—A popular hybrid between this species and *A. Thomsonii* is *A. Frikartii*, raised by Carl Frikart, nurseryman at Stafa, Switzerland; to 2 ft., heads solitary, to 3 in. across, fragrant, rays violet-blue.

17. *A. sedifolius*, L. (*A. acris*, L.). Roughish-hispid per., slender-branched, 2–3 ft. high (a var. dwarf): lvs. linear or lanceolate-linear, 1–1½ in. long, entire, attenuate at both ends, strongly punctate: heads corymbosely clustered, 1–1¼ in. across, the slender peduncles often bracteate; involucre bracts lanceolate, appressed; rays blue, $\frac{1}{2}$ – $\frac{5}{8}$ in. long, spreading or somewhat reflexed; disk yellow. S. Eu.

18. *A. grandiflorus*, L. Much-branched per. to 2½ ft., hispid: lvs. linear to oblong, $\frac{1}{4}$ –2 in. long, entire, sessile: heads solitary at ends of branchlets, 2 in. across; involucre bracts linear or linear-oblong, glandular, leafy, tips spreading; rays deep violet, to 1 in. long. Va. to Fla.—Grown under the name *A. mesa-grande speciosus*.

19. *A. linariifolius*, L. (*Ionactis linariifolius*, Greene). Stiff tufted very leafy per. 1–2 ft. high, branched above: lvs. linear, 1–1½ in. long and to $\frac{1}{2}$ in. wide, entire, sessile, rough, glabrous: heads several, 1 in. across; involucre bracts linear-lanceolate, appressed, ciliate; rays violet, $\frac{1}{2}$ in. long. Me. to Fla. and Tex.

20. *A. ptarmicoides*, Torr. & Gray (*Doellingeria ptarmicoides*, Nees. *Unamia alba*,

Rydb.). WHITE UPLAND ASTER. Per. 1-2 ft. high, with tufted stiff sts. branched near the top: lvs. linear-lanceolate, the lower 3-6 in. long and $\frac{1}{8}$ - $\frac{1}{4}$ in. wide, entire, petioled or sessile, shining, rough on margins: heads $\frac{3}{4}$ -1 in. across, in corymbs; involucre bracts linear-oblong, nearly glabrous; rays white, $\frac{1}{4}$ in. long. Mass. to Ga. and Colo.—A bigeneric hybrid between this species and a *Solidago* is *Solidaster luteus*, M. L. Green (*Solidaster hybridus*, Wehrhahn. *Asterago lutea*, Everett. *Aster hybridus luteus*, Hort.), ray-fls. canary-yellow, disk-fls. golden-yellow.

21. *A. ericoides*, L. (*A. multiflorus*, Ait.). HEATH ASTER. Pubescent much-branched per. 1-7 ft. high: lvs. stiff, linear, $\frac{1}{2}$ -1 in. long, entire, sessile: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. across, densely crowded; involucre bracts with obtuse or mucronate spreading tips, pubescent; rays white, $\frac{1}{8}$ - $\frac{1}{4}$ in. long. Me. to Ga. and Tex.

22. *A. pilosus*, Willd. (*A. ericoides*, Auth. not L. *A. villosus*, Michx. not Thunb. *A. ericoides* var. *villosus*, Torr. & Gray). Differs from *A. ericoides* in longer lvs., somewhat larger heads, and involucre bracts with acuminate appressed tips. Pa. to Ga. and Miss.

52. CALIMERIS, Nees. Aster-like plants, about 10 species native to Asia, one cult. in the border.—Low per. herbs differing from Aster in the hemispherical involucre of more nearly equal scarious-margined bracts in few rows, and broad convex receptacle: achenes flat and hairy. (Calim-eris: Greek *beautiful arrangement*.)

C. incisa, DC. (*C. incisæfolia*, Hort. *Aster incisus*, Fisch.). Erect, leafy-stemmed, 1-2 ft. high, corymbose at summit, finely appressed-hispid: lvs. oblong-lanceolate, remotely incise-dentate, those of the branchlets narrowly oblanceolate and entire or nearly so: heads solitary at the tips of the branchlets, 1 in. across; involucre bracts reddish-tipped, obtuse; rays purple or almost white; disk yellow: pappus much shorter than florets. Siberia.

53. FELICIA, Cass. African subshrubs or rarely ann. herbs, of about 50 species, yielding a fine winter blue.—Lvs. alternate or opposite, entire or dentate: heads radiate, usually long-peduncled; involucre bracts imbricated in 2 to many series, with narrow scarious margins; receptacle flat, usually pitted; rays blue or white, in 1-2 series, usually fertile; disk yellow: achenes flattened; pappus-bristles in 1 series. (Felic-ia: for Herr Felix, a German official, died 1846.)

A. Plant a sparsely hairy subshrub 1-3 ft. high. 1. *F. amelloides*
AA. Plant a very hairy ann. 3-8 in. high. 2. *F. Bergeriana*

1. *F. amelloides*, Voss (*Agathæa celestis*, Cass.). BLUE DAISY. BLUE MARGUERITE. Bushy subshrub 1-3 ft. high, sparsely hairy: lvs. opposite, elliptic or oblong-obovate, about 1 in. long, entire or nearly so, tapering to a short winged petiole: heads solitary, 1-1½ in. across, on long naked peduncles; involucre bracts in 2 series, the outer with herbaceous tips; rays numerous, sky-blue. S. Afr.

2. *F. Bergeriana*, O. Hoffm. (*Cineraria Bergeriana*, Spreng. *Aster Bergerianus*, Harvey). KINGFISHER DAISY. Ann. 3-8 in. high, densely hairy with long spreading hairs: lvs. opposite or alternate, obovate-oblong, 1-1½ in. long, toothed: heads solitary on long pubescent peduncles; involucre bracts in 1 series, with hairy keel; rays bright blue; disk-fls. sterile. S. Afr.

54. ARCTOTIS, L. Herbs, of 30 or more species, mostly native to S. Afr., a few grown in fl.-gardens.—Herbage more or less white-woolly: lvs. alternate: heads of large or medium size, solitary, long-peduncled, radiate; involucre bracts imbricated in several series, the inner scarious; receptacle honeycombed, mostly bristly: achenes grooved, usually villous, ours with tuft of silky hairs at base; pappus crown-like or composed of scales. (Arcto-tis: Greek for *bear's ear*, alluding to the pappus-scales.)

A. Plant with leafy sts.: ray-fls. white or violet. 1. *A. stæchadifolia*
AA. Plant stemless, with scape-like peduncles: ray-fls. yellow or orange.

B. Rays purplish outside: root per. 2. *A. acaulis*
BB. Rays coppery outside: root ann. 3. *A. breviscapa*

1. *A. stæchadifolia*, Berg. AFRICAN DAISY. Bushy per. to 2½ ft., with leafy sts.: lvs. oblong or obovate, 1-4 in. long, usually lyrate and lobed and slightly toothed, white-tomentose when young: heads to 3 in. across, on peduncles much longer than lvs.; outer involucre bracts tomentose; rays white, violet outside; disk violet. Var. *grandis*, Less. (*A. grandis*, Thunb.), is grown as an ann., lvs. to 6 in. long, peduncles 6-12 in. long, fls. Aug.-Sept.

2. *A. acaulis*, L. (*A. scapigera*, Thunb.). Stemless or nearly so, with a thick woody per. root: lvs. oblong, 6-8 in. long, pinnately cut, lobed or lyrate, white-tomentose beneath, green and rough or hairy above: heads 2 in. and more across, on long scape-like hairy

peduncles, blooming spring to autumn; bracts of involucre nearly glabrous, the outer with a recurved tomentose point; rays yellow, purplish outside; disk purple-black.

3. *A. breviscapa*, Thunb. (*A. leptorhiza* var. *breviscapa*, DC.). Stemless, with a slender ann. root: lvs. oblong-lanceolate, to 6 in. long, pinnately cut or lyrate, white-tomentose beneath, green and hairy above: heads to 2 in. across, on hairy scapes 6-18 in. high; outer involucre bracts tomentose, spreading and reflexed, inner glabrous; rays orange-yellow, sometimes with brown or bluish area at base, coppery outside; disk dark brown.

55. **VENIDIUM**, Less. NAMAQUALAND DAISY. S. African plants of about 20 species, grown in the fl.-garden.—Ann. or per. herbs, more or less tomentose: lvs. alternate: heads solitary, long-peduncled, radiate; involucre bracts in several rows, the outer narrower and herbaceous, the inner scarious; receptacle honeycombed, mostly naked; ray-fls. in 1 or few series, usually yellow: achenes glabrous, dorsally 3-5-winged or -ridged, the lateral ridges inflexed, the median straight, narrower; pappus lacking or of 4 minute scales. (Venidium: name of obscure application.)

A. Rays with paler zone at base.....1. *V. decurrens*
AA. Rays with purple-brown zone at base.....2. *V. fastuosum*

1. *V. decurrens*, Less. (*V. calendulaceum*, Less.). Diffuse tomentose per., or grown as ann., sts. 1-2 ft. long: lvs. mostly lyrate, white-tomentose, later becoming glabrate above, on petioles 2 in. and more long; terminal lobe ovate or roundish, sinuate-lobed or repand, to 1½ in. long: heads 1-2½ in. across; rays golden-yellow with paler zone at base; disk yellowish-brown.

2. *V. fastuosum*, Stapf. MONARCH-OF-THE-VELD. Ann. 1-3 ft. high, branched from base, cobwebby when young: lvs. oblanceolate or obovate, to 3½ in. long, irregularly lobed or nearly lyrate, lower on petioles to 2 in. long: heads to 4 in. across; rays bright orange with dark purple-brown zone at base; disk yellowish-brown.

56. **GAZANIA**, Gaertn. (*Meridiana*, Hill, an earlier but rejected name). About 25 herbaceous species native to S. Afr., a few grown in warm sunny climates.—Per. or rarely ann., with short leafy sts. or with lvs. crowded in a basal tuft: lvs. entire or pinnatifid: heads radiate, medium-sized to large, solitary on long peduncles; involucre bracts in 2 to several rows, united and cup-like at base; rays ranging widely in color, white, yellow, orange, scarlet, closing at night; receptacle pitted: achenes villous; pappus of 2 series of delicate scarious toothed scales, often hidden in the wool of the achene. (Gazania: after Theodore of Gaza, 1398-1478, translator of Aristotle and Theophrastus.)

A. Teeth of involucre much shorter than tube, linear and acute.....1. *G. rigens*
AA. Teeth of involucre as long as or longer than tube, linear-subulate and very finely pointed.....2. *G. longiscapa*

1. *G. rigens*, R. Br. (*G. splendens*, Moore. *Gorteria rigens*, L.). Sts. short and densely leafy or diffuse and laxly leafy, 6-12 in. long, with ascending branches: lvs. densely white-tomentose below, green and glabrous above, simple, linear-lanceolate, 4-5 in. long, tapering to a long winged petiole, or some with 1-2 large lateral lobes: heads large and showy, 2½-3 in. across, blooming throughout the year in warm climates, on glabrous peduncles longer than lvs.; rays orange with a black white-eyed spot at base or the basal markings containing brown; involucre glabrous, the teeth short, linear and acute.

2. *G. longiscapa*, DC. Stemless or nearly so: lvs. variable, lanceolate and entire or pinnately cut, white-tomentose beneath, glabrous or nearly so above, margins somewhat revolute and ciliate: heads 1½-3 in. across, on glabrous peduncles longer than lvs.; rays yellow, often with black spot at base; involucre glabrous, the teeth linear-subulate and very finely pointed and as long as or longer than tube, outer bracts ciliate.

57. **URSINIA**, Gaertn. Species about 60, native to S. Afr., a few grown in the fl.-garden.—Glabrous or pubescent ann. or per. herbs or subshrubs, strongly scented: lvs. alternate, mostly pinnatisect: heads radiate, solitary or loosely clustered; involucre bracts in many series, with membranous tips; disk-fls. more or less inclosed in the chaffy bracts of the receptacle: achenes 10-ribbed; pappus (in ours) of 5-6 scales which are enlarged and white in fr. (Ursinia: Johann Ursinus of Regensburg, 1608-1666, author of *Arboretum Biblicum*.)

A. Ray-fls. of one color, yellow: plant per.....1. *U. anethoides*
AA. Ray-fls. yellow marked with purple or brown: plant ann.
B. Under side of rays purple.....2. *U. anthemoides*
BB. Under side of rays yellow.....3. *U. pulchra*

1. **U. anethoides**, N. E. Br. (*Sphenogyne anethoides*, DC.). Shrubby per. 1-2 ft. high, glabrous or thinly webby-pubescent: lvs. crowded, 1-1½ in. long, pinnatisect into semiterete segms.: heads to 1 in. across, solitary on peduncles 6-8 in. long; rays bright golden-yellow.

2. **U. anthemoides**, Poir. (*Sphenogyne anthemoides*, R. Br.). Ann. to 1 ft., glabrous or slightly pubescent: lvs. pinnate into flat linear to filiform segms.: heads about 1 in. across, solitary on long nodding peduncles; rays yellow or orange, purple beneath.

3. **U. pulchra**, N. E. Br. (*Sphenogyne speciosa*, Knowles & Westc.). Leafy-stemmed branching ann. 1-2 ft. high: lvs. bipinnately dissected into linear lobes: heads 1½-2 in. across, solitary on rather long peduncles terminating the branchlets; involucre 4-rowed, the outer rows with a brown scarious border, the inner longer and with a white scarious border; rays bright yellow with purple-brown spot at base; disk darker.

58. **TAGETES**, L. MARIGOLD. Scented herbs of more than 30 species, New Mex. and Ariz. to Argentina, a few popular as fl.-garden plants.—Mostly ann., branching, erect or diffuse, glabrous, with oil-glands on lvs. and involucre: lvs. usually opposite, pinnately dissected or rarely only serrulate: heads radiate, solitary or clustered, small to large; involucral bracts in 1 series, united nearly throughout into a long tube or cup: achenes with pappus of 3-10 unequal scales or bristles. (Tage-tes: Tages, an Etruscan god, or perhaps of other derivation.)

A. Lvs. simple: heads clustered.....1. *T. lucida*

AA. Lvs. compound: heads solitary.

B. Rays few, usually about 5; heads about 1 in. across.....2. *T. tenuifolia*

BB. Rays numerous; heads 1¼-4 in. across.

C. Fls. usually marked with red; heads about 1½ in. across.....3. *T. patula*

CC. Fls. not marked with red; heads 2-4 in. across.....4. *T. erecta*

1. **T. lucida**, Cav. SWEET-SCENTED MARIGOLD. Per. (cult. as an ann.), 1-1½ ft. high, commonly branching: lvs. sessile, oblong-lanceolate or oblanceolate, 2-4 in. long, sharply serrulate, glandular-punctate: heads ½ in. across, 2-3-rayed, golden or orange-yellow, in a dense terminal cluster; involucre narrow-cylindric, glandular-punctate, the short teeth often sharply pointed: achenes with 2 or 3 blunt scales and 2 longer awn-like ones. Mex.

2. **T. tenuifolia**, Cav. (*T. signata*, Bartling). Branching ann., 1-2 ft. high: lvs. pinnately divided into about 12 linear or oblong sharply serrate segms. ¼-¾ in. long, each segm. with 2 rows of large glandular dots: heads solitary, about 1 in. across, yellow, the rays rather few; involucre oblong-cylindric with acutish teeth and large glandular dots: pappus of several scales, 1 or 2 sharp-pointed or awned. Mex. Var. **pumila**, Hort., is dwarf, less than 1 ft. high.

3. **T. patula**, L. FRENCH MARIGOLD. Bushy ann., branched from near base, 1-1½ ft. high: lvs. pinnately divided into about 12 lanceolate or oblong serrate segms. ½-1 in. long, these or their teeth tipped with a long weak awn, each tooth usually with a large gland at base: heads solitary, about 1½ in. across, long-pedunculate, the thick oblong involucre with acute teeth, glandular-dotted; rays numerous, yellow with red markings: pappus of 1-2 long awned scales and 2-3 shorter blunt ones. Mex.

4. **T. erecta**, L. BIG OR AZTEC MARIGOLD. AFRICAN MARIGOLD (once supposed to be native in Afr.). Stout erect branching ann. about 2 ft. high: lvs. pinnately divided into oblong or lanceolate serrate segms. ½-2 in. long, all with a few large glands near the margin and some (or their teeth) tipped with a long weak awn: heads solitary, yellow to orange, 2-4 in. across, the many rays long-clawed, in vars. 2-lipped or quilled, the stout peduncle swollen just below the head; involucre campanulate, the teeth elongate and often dentate: pappus with 1 or 2 long awned scales and 2 or 3 shorter blunt ones. Mex.

59. **BAILEYA**, Harvey & Gray. DESERT-MARIGOLD. White-woolly herbs of about 3 species in W. N. Amer.—Lvs. alternate, upper entire, lower pinnatifid: heads solitary on long peduncles; involucre of 2-3 series of distinct nearly equal woolly bracts; ray-fls. 5-50, yellow, persistent on achene and becoming papery and reflexed: achenes striate and glabrous: pappus none. (Ba-ileya: named for Jacob Whitman Bailey, 1811-1857, West Point, American chemist and microscopist.)

B. multiradiata, Harvey & Gray. Bien. or per. to 1½ ft.: lvs. mostly basal, pinnatifid, upper few and entire: heads 1½-2 in. across, on naked peduncles 6-12 in. long; rays 20-50, toothed. Utah to Calif. and Mex.

60. **ERIOPHYLLUM**, Lag. About 11 herbaceous species, white-woolly at least when young, native in W. N. Amer.—Lvs. alternate, entire or pinnatisect: heads solitary or in corymbs at ends of branches; involucral bracts in 1 series, usually distinct, stiff and erect; receptacle convex or flat, naked, pitted; ray-fls. yellow,

pistillate and fertile, in 1 series; disk-fls. yellow, bisexual: achenes 4-angled; pappus of scales or rarely lacking. (Eriophyllum: Greek *wool* and *leaf*.)

E. lanatum, Forbes (*Actinella lanata*, Pursh. *Bahia lanata*, DC. *E. cæspitosum*, Dougl.). Per. to 2 ft.: lvs. variable, 1-2½ in. long, the st.-lvs. pinnatifid into oblong entire, toothed or lobed segms., becoming glabrous and green above, margins revolute: heads ¾-1½ in. across, solitary or in loose corymbs; rays 8-12, ½-¾ in. long, toothed at apex. B. C. to Ore. and Mont.

61. GAILLARDIA, Foug. About 20 American species, mostly from the far West, several cult. in borders and fl.-gardens.—Ann. or per. herbs with leafy sts., erect or branching or reduced to a short caudex: lvs. alternate or basal, more or less toothed, punctate-dotted: heads radiate, showy, solitary on long peduncles; rays yellow or yellow and red, neutral, 3-toothed or -cleft giving the head a fringed appearance; disk-fls. purple, fertile; involucre broad, the bracts in 2-3 series; receptacle convex or globose, with small bristle-like fringe among the fls.: achenes densely villous or with villous hairs only at base; pappus of 5-10 mostly awned scales. (Gaillardia: named for M. Gaillard, patron of botany in France.)

A. Plant ann.: fls. normally red.

B. Rays red throughout; lobes of disk-fls. obtuse: lvs. sessile and auriculate. 1. *G. Amblyodon*

BB. Rays red tipped with yellow; lobes of disk-fls. acute or awned: lvs. nearly sessile. 2. *G. pulchella*

AA. Plant per.: fls. normally yellow. 3. *G. aristata*

1. **G. Amblyodon**, J. Gay. Ann. 1-2 ft. high, leafy to the top, mostly hirsute: lvs. oblong or the lower spatulate, 1-3 in. long, auriculate and sessile, entire or nearly so: heads 2 in. across; rays numerous, brown-red throughout; lobes (or teeth) of the disk-corollas short and obtuse; achenes with villous hairs only at base. (Amblyodon: a genus of mosses with blunt peristome-teeth.) Tex.

2. **G. pulchella**, Foug. Erect branching ann. 12-20 in. high, soft-pubescent: lvs. oblong, lanceolate or spatulate, 2-4 in. long, nearly sessile, entire or the lower lyrate-pinnatifid: heads 2 in. across; rays flat, yellow at tip and rose-purple at base; lobes of disk-fls. acute or awned: achenes hairy all over. Va. to Fla. and New Mex. Var. *picta*, Gray (*G. picta*, Sweet), is the usual cult. form, with somewhat succulent lvs. and large heads in different shades, in *Lorenziana* the ray-fls. and sometimes disk-fls. enlarged and tubular.

3. **G. aristata**, Pursh (*G. grandiflora*, *lutea*, *maxima* and *perennis*, Hort.). Erect per. 2-3 ft. high, more or less hirsute: lvs. lanceolate or oblong or lower spatulate, 2-8 in. long, entire to sinuate-pinnatifid; heads 3-4 in. across, the flat rays yellow or with purple base; lobes of disk-corollas acuminate: achenes densely hairy all over. Colo. to B. C. and Ore.

62. ACTINEA, Juss. American ann. or per. herbs, one grown in the rock-garden.—Lvs. alternate, entire or pinnatisect, resinous-dotted: heads solitary, of yellow ray- and disk-fls.; involucre bracts in 2 or more series, distinct or somewhat united at base, stiff and erect: pappus of 5-12 scales. (Actinea: from Greek for ray.)

A. herbacea, Rob. (*Actinella scaposa* var. *glabra*, Gray. *Tetranneuris herbacea*, Greene). Tufted per.: lvs. basal, linear-spatulate, 2-3 in. long, hairy but becoming nearly glabrous: heads 2-2½ in. across, on hairy scapes 4-8 in. high; involucre hairy; rays about ½ in. long, toothed. Ont. to Ill.

63. HELENIUM, L. SNEEZEWEED. Coarse erect ann. or per. herbs of over 30 species, N. Amer., Mex.—Lvs. alternate, often decurrent on the st., entire or toothed, punctate with dark dots: heads mostly radiate, solitary or corymbose, yellow or brownish; involucre bracts in 2 or 3 series, spreading or soon reflexed, mostly herbaceous; receptacle convex to oblong, naked; rays wedge-shaped, 3-5-lobed, commonly drooping: pappus of usually 5-6 thin scales. (Helenium: possibly from Helenus, the son of Priam.)

A. Lvs. not decurrent on the st. and branches: sts. tomentose when young. 1. *H. Hoopesii*

AA. Lvs. decurrent on the st. and branches: sts. not tomentose.

B. Heads solitary or few on long peduncles. 2. *H. Bigelovii*

BB. Heads numerous, in corymbs.

C. Disk brownish or purplish, globose: upper lvs. entire. 3. *H. nudiflorum*

CC. Disk yellow or reddish, subglobose or hemispheric: lvs. mostly serrate or dentate. 4. *H. autumnale*

1. **H. Hoopesii**, Gray (*Dugaldia Hoopesii*, Rydb.). Stout per. 1-3 ft. high, sts. tomentose when young, becoming glabrate, leafy, bearing 1 to several large long-pedunculate heads: lvs. entire, oblong-lanceolate, or the lower spatulate, not decurrent at base, 4-10 in. long, yellowish-green: heads yellow, commonly 3 in. across, the rays only slightly drooping. (First collected by Thos. Hoopes.) Rocky Mts. to Ore. and Calif.

2. *H. Bigelovii*, Gray. Per. with simple sts. 2-4 ft. high, slightly pubescent or glabrous: lvs. lanceolate, 4-10 in. long, entire, decurrent at base, strongly glandular-punctate: heads to $2\frac{1}{2}$ in. across, solitary or 2-3 on long peduncles; rays yellow, pistillate; disk brown or brownish-yellow. (Named for its discoverer, Dr. John M. Bigelow, 1804-1878.) Ore. to Calif.

3. *H. nudiflorum*, Nutt. Per. 1-3 ft. high, sts. roughish, leafy: lvs. narrowly lanceolate to oblong, 2-6 in. long, entire, or the basal spatulate and toothed: heads 1-2 in. across, corymbose, short-peduncled, the drooping wedge-shaped neutral rays yellow, brown-purple or striped with both colors; disk globose, brownish or purplish. Conn. to Fla. and Tex.

4. *H. autumnale*, L. (*H. grandiflorum*, Nutt.). Leafy-stemmed nearly glabrous per. 2-6 ft. high: lvs. lanceolate to ovate-lanceolate, 2-5 in. long, decurrent at base, mostly toothed: heads 1-2 in. across, corymbose at the ends of the st. and branches; rays pistillate, drooping, 3-cleft, yellow; disk hemispheric or subglobose, yellow. Que. to Fla. and Ariz.—Some of the hort. vars. are: *gaillardiaeflorum*, rays bronzy-red tipped with golden-yellow; *peregrinum*, rays mahogany-red faintly edged with yellow; *pumilum*, 1-2 ft. high, free-blooming; *rubrum*, fls. deep red; *superbum*, fls. large.

64. **DIMORPHOTHECA**, Vaill. CAPE-MARIGOLD. Herbs or subshrubs of 7 species in S. Afr., two grown in the fl.-garden.—Lvs. alternate, entire to pinnatifid: heads solitary on terminal peduncles; involucre broadly campanulate, bracts in 1 series, with scarious margins; receptacle naked; ray-fls. pistillate and fertile, in 1 row, style divided into 2 long stigmatic branches; disk-fls. bisexual and fertile, style divided into 2 very short branches: achenes of ray-fls. 3-angled or nearly terete, usually wrinkled or tuberculate, of disk-fls. smooth and with thickened margins. (*Dimorphothe-ca*: Greek *two-formed achenes*.)

A. Rays orange-yellow. 1. *D. sinuata*
 AA. Rays white above, violet or purple beneath. 2. *D. pluvisalis*

1. *D. sinuata*, DC. (*D. calendulacea*, Harvey. *D. aurantiaca*, Hort. not DC.). Ann. 4-12 in. high, loosely branching from base, sts. ascending, glandular-pubescent throughout: lvs. oblong-lanceolate, to $3\frac{1}{2}$ in. long and 1 in. wide, narrowed at base, coarsely sinuate-dentate, upper lvs. smaller and sessile; heads $1\frac{1}{2}$ in. across; rays orange-yellow, sometimes deep violet at base, style-branches violet; disk yellow.—Hybrids occur between this species and *D. pluvisalis*, known as *D. aurantiaca hybrida*, with rays yellow above mixed with violet or purple below.

2. *D. pluvisalis*, Moench (*Calendula pluvisalis*, L. *D. annua*, Less.). Ann. 4-16 in. high, usually branched with ascending sts., densely glandular-pubescent: lvs. obovate to ob-lanceolate, to $3\frac{1}{2}$ in. long and 1 in. wide, narrowed at base, coarsely sinuate-dentate, upper linear and sessile; heads 1-2 in. across; rays white above, violet or purple beneath or mixed with copper or other colors, style-branches deep violet; disk yellow, corolla-lobes often violet at tips. Var. *ringens*, Hort., has pure white fls. with a blue ring around the center.

65. **CASTALIS**, Cass. Per. herbs, 3 species native in S. Afr.—Lvs. alternate, entire or pinnatifid: heads solitary at ends of branchlets, peduncled; involucre broadly campanulate, bracts in 1-2 series, with scarious margins; receptacle naked; ray-fls. pistillate and sterile, in 1 row, yellow or violet, style none or undivided; disk-fls. bisexual and fertile, style divided into 2 very short branches: achenes with thickened margins, smooth. (*Castal-is*: for the nymph Castalia.)

C. spectabilis, Norl. (*Dimorphothea spectabilis*, Schlechter). To 16 in. from a woody rootstock, sts. single or few, glandular-pubescent: lvs. lanceolate or narrowly elliptic, 1-2½ in. long and to ½ in. wide, sessile, entire or rarely 1-3-toothed: heads to 2½ in. across; rays lilac-purple on both sides; disk yellow with violet corolla-lobes. Transvaal.—This plant does not appear to be in cult., although the name *Dimorphothea spectabilis* is frequently listed.

66. **OSTEOSPERMUM**, L. Nearly 70 species, native S. Afr. to Arabia, one grown for ornament.—Herbs, subshrubs or shrubs: lvs. alternate or rarely opposite, entire to pinnatifid: involucral bracts in 1-3 series, with scarious margins; receptacle naked; ray-fls. pistillate and fertile, in 1 row, yellow or violet, style filiform and divided into 2 stigmatic branches; disk-fls. sterile, style shortly 2-lobed: achenes terete or 3-angled, smooth or tuberculate. (*Osteosper-mum*: Greek for *bone* and *seed*, referring to the hard achenes.)

O. Ecklonis, Norl. (*Dimorphothea Ecklonis*, DC.). Shrub or subshrub 3-4 ft. high, branching: lvs. obovate or oblanceolate, narrowed into petiole, 2-4 in. long and $\frac{1}{4}$ -¾ in.

wide, remotely toothed, glandular-pubescent: heads solitary and long-peduncled at ends of branches or in loose corymbs, 2-3 in. across; rays white above, violet or blue beneath often with a white border; disk azure-blue. (Named for C. F. Ecklon, page 42.) S. Afr.

67. **CALENDULA**, L. Species about 15, from Medit. region, Canary Isls. to Iran; yields an old herb grown in several races for ornament.—Ann. or per. herbs with simple alternate lvs. and mostly large heads with yellow or orange rays: involucre broad, the usually scarious-margined bracts in 1 or 2 rows; receptacle naked, plane: ray-achenes glabrous, incurved; disk-fls. infertile; pappus none. (Calendula: Latin *calendæ* or *calends*, throughout the months.)

C. officinalis, L. POT-MARIGOLD. More or less hairy ann. 1-2 ft. high: lvs. thickish, oblong to oblong-obovate, 2-6 in. or more long, entire or minutely and remotely denticulate, more or less clasping: heads solitary, on stout stalks, showy, $1\frac{1}{2}$ -2 or 4 in. across, the flat spreading rays white-yellow to deep orange, closing at night, blooming the whole season; sometimes the plant is proliferous from the involucre, bearing several peduncled heads in a circle. S. Eu. Var. **chrysanth**, Hort. (*C. chrysanth*, Hort.), is a strain with chrysanthemum-like double buttercup-yellow fls.—A common fl.-garden ann.; also grown under glass for winter bloom. The heads are said to have been used sometimes for flavoring in cookery.

68. **GAMOLEPIS**, Less. Herbs or mostly small shrubs, of about a dozen species native to S. Afr., one cult. for edgings and for fls.—Lvs. alternate and mostly pinnatisect: heads solitary, pedunculate; involucre of 1 series of bracts united one-third or one-half their length or more; ray-fls. yellow, pistillate, in 1 series; disk-fls. fertile: achenes without pappus, wingless and glabrous. (Gamolepis: Greek *united scales*, referring to the involucre.)

G. Tagetes, DC. (*Othonna Tagetes*, L. *G. annua*, Less.). Glabrous wiry ann. 1 ft. or less high, much-branched and very floriferous: lvs. $1-1\frac{1}{2}$ in. long, pinnately parted into linear segms., these often saliently toothed or pinnatifid: heads bright yellow or orange, $\frac{3}{4}$ in. across; involucre nearly or quite urn-shaped, the bracts united for more than half their length. (Tagetes: a genus of Compositæ.)

69. **GYNURA**, Cass. (*Crassocephalum*, Moench). About 24 species in the warmer parts of Asia and Afr., grown under glass as foliage plants.—Herbs or rarely subshrubs: lvs. alternate, entire or lobed, numerous: heads discoid, not very showy; involucre cylindric or bell-shaped, of numerous bracts in 1 series with several very narrow spreading accessory bracts at base: achenes 5-10-striate, with copious slender white pappus-bristles. (Gynura: name referring to the tailed stigmas.)

G. aurantiaca, DC. VELVET-PLANT. Stout and branching, 2-3 ft. high; sts. almost succulent, densely pubescent with violet or purple hairs: lvs. soft, ovate, 3-6 in. and more long, jagged-toothed, hairy, with short often narrowly winged petioles, the wings with few remote salient teeth; uppermost lvs. sessile, clasping: heads to $\frac{3}{4}$ in. across, in loose terminal clusters, yellow or orange. Java.

70. **EMILIA**, Cass. Slender plants, about a dozen species, in warm parts of Afr., Asia to China, Polynesia and Amer., one species cult. for its fls.—Ann. or per. herbs with alternate lvs.: heads rayless, rather small, solitary or clustered; involucre in 1 series, cup-shaped, with no small outer bracts; florets all bisexual: achenes with 5 acute ciliate angles; pappus of soft white bristles. (Emilia: perhaps a personal name.)

E. sagittata, DC. (*Cacalia sagittata*, Vahl. *C. coccinea*, Sims. *E. flammea*, Cass.). TASSEL-FLOWER. FLORAS-PAINTBRUSH. Erect ann. 1-2 ft. high, glabrous or sparsely hairy: basal lvs. and lowest st.-lvs. narrowly wing-petioled, rotund or elliptic; middle st.-lvs. oblong or elliptic, broadly wing-petioled or narrowed below to a sessile auriculate-clasping base; upper st.-lvs. oblong-lanceolate or ovate-lanceolate, acute or acuminate, with broad sagittate-clasping base: heads scarlet, loosely corymbed, about $\frac{1}{2}$ in. across, from June till frost. Tropics. Var. **lutea**, Hort. (*Cacalia aurea*, Hort.), heads golden-yellow.

71. **KLEINIA**, L. Succulent herbs or shrubs, of perhaps 20 species in S. Afr.—Often united with Senecio, differing mainly in the style-branches minutely conetipped: heads of disk-fls. only. (Named for J. Th. Klein, 1685-1759, German naturalist.)

- A. Heads orange or red. 1. *K. fulgens*
 AA. Heads white or pale yellow.
 B. Sts. prostrate and rooting. 2. *K. radicans*
 BB. Sts. erect.
 c. Lvs. flat, deeply lobed. 3. *K. articulata*
 cc. Lvs. cylindrical or semi-cylindrical, entire.
 d. Tip of lf. blunt: heads 2-3. 4. *K. repens*
 dd. Tip of lf. sharp: heads 10-13. 5. *K. Mandraliscae*

1. *K. fulgens*, Hook. f. (*Senecio fulgens*, Nichols.). Herb or subshrub 2-3 ft. high, pale green and glaucous: lvs. spatulate, to $3\frac{1}{2}$ in. long and $1\frac{1}{4}$ in. wide, obtuse, narrowed at base into winged petiole, with 2-3 teeth on either side: heads 1-2, red or orange, 1 in. across, on bracted peduncles 4-8 in. long.

2. *K. radicans*, Haw. (*Cacalia radicans*, L. f. *Senecio radicans*, Sch. Bip.). Sts. prostrate and rooting, 1-2 ft. long, bearing lvs. on one side only: lvs. cylindrical, $1-1\frac{1}{2}$ in. long and about $\frac{1}{2}$ in. thick, pointed at both ends, gray-green: heads 1-2, white, $\frac{1}{2}-\frac{3}{4}$ in. across, on long naked peduncles.

3. *K. articulata*, Haw. (*Cacalia articulata*, L. f. *Senecio articulatus*, Sch. Bip.). CANDLE-PLANT. Sts. 1-2 ft. high, branches swollen and jointed: lvs. 1-2 in. long, deeply lobed, the end lobe largest and acute, on petioles as long as or longer than blade: heads white, about $\frac{1}{2}$ in. across, in corymbs on naked peduncles 4-10 in. long.

4. *K. repens*, Haw. (*Cacalia repens*, L. *Senecio succulentus*, Sch. Bip.). Subshrub to 1 ft., from a creeping rootstock: lvs. clustered at tips of branches, cylindrical or flattened above, 2-3 in. long and $\frac{1}{2}$ in. wide, blunt, glaucous: heads 2-3, white, about $\frac{1}{2}$ in. across, on naked peduncles about twice as long as lvs.

5. *K. Mandraliscae*, Tineo. Subshrub 10-12 in. high: lvs. semi-cylindrical, flattened above, 3-4 in. long and $\frac{1}{2}$ in. wide, sharp-pointed, glaucous: heads 10-13, whitish, on naked peduncles much longer than lvs. (Collected by Count Mandralisca on the island of Vulcano in the Medit. where it is adventive.)

72. *OTHONNA*, L. Species about 80, native to S. Afr., one sometimes grown in hanging baskets and on greenhouse benches.—Shrubs or herbs, the latter often with thickened roots: lvs. often fleshy, basal or cauline, the st.-lvs. alternate or clustered at the ends of the branches: heads solitary or clustered, commonly yellow; involucre bracts in 1 series, more or less united at base; rays fertile; disk-fls. sterile, tubular, style not divided: pappus of copious bristles. (Othon-na: ancient Greek name of no particular application here.)

O. capensis, Bailey (*O. crassifolia*, Harvey not L.). Nearly glabrous per. with slender trailing or drooping sts., becoming shrubby at base: lvs. scattered or in clusters, fleshy and cylindric-obovoid, sharp-pointed, 1 in. or less long, woolly at base: heads nearly or quite $\frac{1}{2}$ in. across, solitary or few on slender ascending peduncles 2-6 in. long; rays bright yellow, narrow, wide-spreading.—Blooming in nearly all seasons, the fls. opening only in sun.

73. *ARNICA*, L. Per. herbs of the northern hemisphere, about 50 species, one sometimes grown in the rock-garden.—Lvs. opposite or the basal lvs. clustered: heads long-peduncled, yellow; involucre of 1-2 series of nearly equal bracts; receptacle not chaffy; ray-fls. pistillate and fertile; disk-fls. bisexual and fertile; style with slender branches: achenes ribbed; pappus of stiff slender bristles. (Ar-nica: derivation uncertain.)

A. montana, L. Sts. erect, 1-2 ft. high, simple or slightly branched, hairy: basal lvs. forming a rosette, oblong, 2-5 in. long, sessile, entire, short-hairy, st.-lvs. few and smaller: heads deep yellow, solitary or few, 2-3 in. across; involucre hairy and glandular: pappus yellowish. Eu.

74. *DORONICUM*, L. LEOPARDS-BANE. Per. herbs; 30 or more species, native to Eu. and temp. Asia, several cult. for their fls.—Sts. simple or somewhat branched: basal lvs. long-petioled; st.-lvs. alternate, often clasping: heads yellow, long-peduncled, 1 to several at the end of st.; involucre bracts in 2-3 nearly equal series; receptacle convex, not chaffy, often hairy; ray-fls. pistillate, in 1 series; disk-fls. bisexual: achenes 10-ribbed; pappus 1-2 series of simple hairs, often lacking in ray-fls. (Doron-icum: Latinized Arabic name.)

- A. Basal lvs. not cordate at base.
 B. Ray-fls. without pappus. 1. *D. plantagineum*
 BB. Ray-fls. with pappus. 2. *D. Clusii*
 AA. Basal lvs. cordate at base.
 B. Heads solitary, on nearly naked peduncles. 3. *D. caucasicum*

BB. Heads usually several, the sts. leafy to top.

- c. Plant not stoloniferous, without cluster of basal lvs. at flowering time 4. *D. austriacum*
cc. Plant stoloniferous, with cluster of basal lvs. at flowering time 5. *D. Pardalianches*

1. *D. plantagineum*, L. (*D. excelsum*, Hort.). Rhizome tuberous, roundish or creeping obliquely, stoloniferous; sts. stout, 2-5 ft. high, pubescent and glandular above; basal lvs. ovate or oblong-ovate, wavy-margined, long-petioled; lower st.-lvs. entire or toothed, ovate, abruptly narrowed into a broad-winged clasping petiole; upper st.-lvs. sessile, oblong or oblong-ovate, more or less toothed; heads $1\frac{1}{2}$ -4 in. across, solitary or rarely 2-3 on peduncles terminating the sts. and branches; ray-fls. without pappus. S. Eu.

2. *D. Clusii*, Tausch (*Arnica Clusii*, All.). About 2 ft. high, with creeping rhizome; sts. hairy and glandular above; basal and lower st.-lvs. oblong to oval, narrowed to short winged petiole, toothed, hairy on edges; upper st.-lvs. partially clasping; heads solitary, $1\frac{1}{2}$ -2 in. across; ray- as well as disk-fls. with pappus. (Named for Chas. de l'Escluse, page 220.) Swiss and Austrian Alps.

3. *D. caucasicum*, Bieb. Stoloniferous, sts. $1-1\frac{1}{2}$ ft. high, somewhat pubescent; lvs. coarsely dentate, the basal subrotund, deeply cordate, petiolate; lower st.-lvs. petiolate, subcordate; upper st.-lvs. ovate, cordate-clasping, those near the head linear-lanceolate; heads solitary on nearly naked peduncles, $1\frac{1}{2}$ -2 in. across; ray-fls. without pappus. Sicily to Asia Minor. Var. *magnificum*, Hort., is more robust with larger heads.

4. *D. austriacum*, Jacq. Hairy per. with stout rootstock; sts. somewhat branched, 2-4 ft. high; lvs. dentate, the basal petioled, ovate-rhombic, cordate at base, not present at flowering time; lower st.-lvs. ovate, cordate, the petiole with a broad wing which is cordate-clasping at base; upper st.-lvs. sessile, cordate-clasping at base; heads usually several, on leafy sts., about 2 in. across; ray-fls. without pappus. Eu.

5. *D. Pardalianches*, L. Stoloniferous, with basal rosettes at flowering time; sts. 1-4 ft. high, hairy and glandular above; basal lvs. deeply cordate, with long winged petiole, entire or slightly toothed, hairy and ciliate; st.-lvs. oblong-lanceolate, cordate and clasping, toothed or entire; heads several on sts. with scattered lvs., $1\frac{1}{2}$ -2½ in. across; ray-fls. without pappus. (Pardalianches: from Greek for *panther* and *choke*.) Eu.

75. **LIGULARIA**, Cass. Per. herbs from W. Eu. to Siberia, Himalayas and China-Japan, about 30 species, grown in the open or indoors.—Lvs. alternate or sometimes all basal, mostly long-petioled, broad or orbicular or reniform, sometimes palmate, those of the st. smaller and bearing large sheaths; heads large, reflexed or nodding, in corymbs or racemes; involucrel bracts in 1 series at the insertion, but of two forms, so that the narrow outer ones overlap the edges of the broader inner ones; rays mostly long and narrow, usually yellow; achenes glabrous, bearing soft pappus. (Ligularia: name refers to the strap-shaped or more or less bilabiate fls.)

- A. Margin of lvs. sharply toothed: rays orange-yellow 1. *L. clivorum*
AA. Margin of lvs. repand-angulate: rays light yellow 2. *L. Kaempferi*

1. *L. clivorum*, Maxim. (*Senecio clivorum*, Maxim.). Robust per. 4 ft. high, at first tawny-pubescent, glabrate: basal lvs. long-petiolate, reniform or subrotund, sometimes 20 in. diam., sharply mucronate-dentate; fl.-sts. branched; heads to 4 in. across, many-fl'd., with orange-yellow rays; disk-fls. dark brown. (Clivorum: of the hills.) Japan, China.

2. *L. Kaempferi*, Sieb. & Zucc. (*L. Farfugium*, Koch. *Farfugium Kaempferi*, Benth. *Senecio Kaempferi*, DC.). Rhizomatous per. sending up many lvs. on slender flocculent-woolly petioles; lvs. often 6-10 in. across, orbicular to nearly reniform, cordate at base, angular-toothed, green; fl.-sts. 1-2 ft. tall, flocculent-woolly, branched, with only small bract-like lvs.; heads with light yellow rays spreading $1\frac{1}{2}$ -2 in. across; pappus white and copious. (Engelbert Kaempfer, page 273.) Japan. Var. *aureo-maculata*, Hook. (*Farfugium grande*, Lindl. *F. maculatum*, Hort.), LEOPARD-PLANT, is commonly cult. for its lvs. which are blotched with yellow or white or sometimes with light rose, seen in window-gardens.

76. **SENECIO**, L. GROUNDSEL. One of the largest genera of plants, about 1,200 species when broadly interpreted, in all parts of the world, a number cult. for their fls. or foliage, or for their climbing habit.—Herbs, shrubs or even trees, with alternate lvs. or sometimes the lvs. all basal: heads solitary or clustered, variously colored, usually radiate, the rays fertile; disk-fls. tubular, 5-toothed; involucrel bracts in 1 series usually reinforced at base by shorter bracts or bracteoles having a calyx-like appearance; achenes mostly terete and ribbed; pappus of soft whitish often copious bristles. (Senecio: Latin name for plants of this genus, ultimately from *senex*, "old man," said to be in allusion to the hoary pappus.)

A. Habit climbing.

- B. Ray-fls. lacking 1. *S. mikanioides*

- BB. Ray-fls. present.
 c. Heads yellow, $\frac{1}{2}$ in. across: lvs. finely pubescent..... 2. *S. scandens*
 cc. Heads orange or orange-red, $\frac{3}{4}$ –1 in. or more across: lvs. glabrous..... 3. *S. confusus*
 AA. Habit not climbing.
 B. Lvs. not pinnatifid, although toothed or shallowly lobed.
 c. Rays yellow.
 d. Plant shrubby, hairy..... 4. *S. Petasitis*
 dd. Plant herbaceous, glabrous..... 5. *S. aureus*
 cc. Rays red, purple or white.
 d. Shape of lvs. cordate-ovate..... 6. *S. cruentus*
 dd. Shape of lvs. oblong-lanceolate, attenuate at base..... 7. *S. pulcher*
 BB. Lvs. pinnatifid.
 c. Plant white-woolly.
 d. Segms. of lvs. oblong, becoming green above..... 8. *S. Cineraria*
 dd. Segms. of lvs. linear, white on both surfaces..... 9. *S. leucostachys*
 cc. Plant not white-woolly.
 d. Rays purple..... 10. *S. elegans*
 dd. Rays yellow or orange.
 E. Basal lvs. bipinnate..... 11. *S. abrotanifolius*
 EE. Basal lvs. cordate-ovate..... 5. *S. aureus*

1. *S. mikanioides*, Otto (*S. scandens*, DC.). GERMAN-IVY. Slender and glabrous, tall-twining; lvs. ovate or deltoid-ovate, mostly with a deep basal sinus, sharply 5–7-angled or angle-lobed; heads about $\frac{1}{2}$ in. across, of 8–10 disk-fls., yellow, in close clusters on axillary and terminal branches. S. Afr.

2. *S. scandens*, Buch.-Ham. not DC. Sts. woody, climbing, reaching a height of several ft., branches slightly hirsute; lvs. short-petiolate, ovate- or elliptic-lanceolate, undivided or with 2 or more divisions at base of blade, triangular-dentate, grayish-green and finely pubescent on both surfaces: infl. a terminal panicle; heads about $\frac{1}{2}$ in. across; rays commonly 8, yellow. China.

3. *S. confusus*, Britten. Glabrous woody climber, sts. to 15 ft. or more: lvs. ovate or ovate-lanceolate, 1–4 in. long and $\frac{1}{2}$ –2 in. wide, coarsely toothed; heads $\frac{3}{4}$ –1 in. or more across, in terminal clusters; rays about 15, orange or orange-red; disk-fls. 60 or more. Mex.

4. *S. Petasitis*, DC. (*Cineraria Petasitis*, Sims). VELVET GROUNDSEL. CALIFORNIA-GERANIUM. Robust shrubby per. 3–8 ft. high, somewhat velvety-hirsute on the younger parts: lvs. petiolate, broadly ovate or suborbicular, $1\frac{1}{2}$ –8 in. wide, cordate to subtruncate at base, sinuately 9–13-lobed, callous-denticulate, somewhat hairy above, grayish-tomentose beneath: infl. a terminal many-headed panicle; heads about $\frac{1}{2}$ in. across; rays usually 5, yellow; disk-fls. about 15. (Petasitis: Greek *broad-brimmed* or *sun-hat*, in reference to the large rounded lvs.) S. Mex.

5. *S. aureus*, L. GOLDEN RAGWORT. Per. 1–2½ ft. high, glabrous or nearly so: basal lvs. cordate-ovate or reniform, 1–6 in. long, obtuse, long-petioled, coarsely toothed, sometimes purplish beneath; st.-lvs. lanceolate or oblong, pinnatifid or lyrate: heads $\frac{1}{2}$ –¾ in. across, in corymbs; rays 8–12, yellow. Newf. to Fla. and Tex.

6. *S. cruentus*, DC. (*Cineraria cruenta*, Masson). FLORISTS CINERARIA. Short-stemmed floccose-woolly per.: lvs. large, cordate-ovate to cordate-triangular, angled or undulate and sinuate-toothed, rather long-stalked, dark green above, white-tomentose beneath: heads $\frac{1}{2}$ –1 in. across in the wild; rays purple-red. Canary Isls.—*S. cruentus* is the supposed parent of the florists' cineraria now modified by cult., its large double fls., to 3 in. across, running in white and in shades of blue, pink and purple-red. The plant sold under the name *Cineraria stellata* (Star Cineraria) is an open grower, 2 ft. high, whose heads are single, mostly smaller and not borne in the solid masses of the florists' cineraria; its rays are separated as in the wild aster.

7. *S. pulcher*, Hook. & Arn. Robust erect per. 2–4 ft. high, white-cobwebby, sts. simple or nearly so, scarcely leafy: lvs. oblong-lanceolate, 4–10 in. and more long, thick, shallow-lobed and crenate-toothed, basal lvs. attenuate at base into broad petiole, upper lvs. clasping: heads 2–3 in. across, in corymbs, with many long red-purple rays and a yellow disk. Uruguay, Argentina.

8. *S. Cineraria*, DC. (*Cineraria maritima*, L. *Senecio acanthifolius*, Hort.). DUSTY MILLER. Stiff per. 2½ ft. or less tall, branching from base, very white-woolly: lvs. pinnatifid, with oblong obtuse segms., becoming green above: heads usually radiate, $\frac{1}{4}$ –½ in. across, in small compact cymes, yellow or cream-color. (Cineraria: Latin *ash*, from the ashy color of foliage.) Medit. region.

9. *S. leucostachys*, Baker (*S. Cineraria* var. *candidissimus*, Hort.). Often confused with *S. Cineraria* but habit not so stiff. lvs. white on both surfaces, the segms. linear and acute, heads somewhat larger. Argentina.

10. *S. elegans*, L. (*S. purpureus*, Hort. *Jacobæa elegans*, Moench). PURPLE RAGWORT. Viscid-pubescent ann., erect or diffuse, 1–2 ft. high: lvs. various, mostly oblong, 1–3 in. long, pinnate, lobed or toothed with sinuses chiefly broad and rounded, clasping at base: heads $\frac{3}{4}$ –1 in. across, in loose corymbs; rays purple or reddish varying to white; disk-fls. yellow. S. Afr.—Fls. sometimes double.

11. *S. abrotanifolius*, L. Per. 6–18 in. high, with creeping rootstock, sts. ascending, glabrous or slightly pubescent: lower lvs. bipinnate, upper pinnate into linear-lanceolate acute segms.: heads 1–2 in. across, in corymbs; rays 10–13, orange-yellow. Eu. Var. *tirolensis*, Hegi (*S. tirolensis*, Kerner), is very similar, with orange-red rays.

77. **LEONTOPODIUM**, R. Br. EDELWEISS. Low plants of over 30 species, native to the mts. of Eu., Asia and S. Amer., sometimes grown in rock-gardens for ornament and interest.—Per. herbs, tufted and woolly; sts. ascending or erect, simple or branched at the very top: lvs. entire, basal or those of the st. alternate: heads discoid, small, crowded into dense cymes at the top of the st., surrounded by a tuft of floral lvs.; bisexual fls. sterile: pappus of bristles. (*Leontopodium*: Greek *lion's foot*.)

A. Lvs. oblong to lanceolate. 1. *L. alpinum*
AA. Lvs. linear to linear-lanceolate. 2. *L. leontopodioides*

1. *L. alpinum*, Cass. (*Gnaphalium Leontopodium*, L.). ALPINE EDELWEISS. White-woolly plant 4–12 in. high, creeping by rootstocks: lvs. oblong-ob lanceolate, in age shedding the wool from their upper surface: heads 7–9, about $\frac{1}{4}$ in. across, closely crowded together, surrounded by a tuft of densely and persistently white-woolly oblong or lanceolate floral lvs. which far surpass the heads; involucre bracts densely woolly, with blackish tips. High mts., Eu., Asia.

2. *L. leontopodioides*, Beauverd (*Gnaphalium leontopodioides*, Willd. *L. sibiricum*, Cass.). SIBERIAN EDELWEISS. Differs from *L. alpinum* chiefly in the narrower linear to linear-lanceolate lvs. and the larger heads. Russia to Korea.

78. **INULA**, L. Species over 100 in Eu., Asia and Afr., affording showy perennials for borders and fl. gardens.—Usually per. herbs, more or less glandular and hairy: lvs. alternate or basal, entire or serrate; heads radiate, solitary or clustered; rays pistillate, 3-toothed, yellow, rarely white; disk-fls. bisexual, with tubular corollas 5-toothed; receptacle pitted, not chaffy; involucre bracts imbricated in several series: achenes 4–5-ribbed; pappus consisting of bristles. (*In-ula*: ancient name.)

A. Foliage glabrous except for ciliate margins and nerves beneath.

B. Lvs. linear-lanceolate, parallel-veined, base attenuate and sessile. 1. *I. ensifolia*

BB. Lvs. oblong-lanceolate, netted-veined, base cordate and clasping. 2. *I. salicina*

AA. Foliage villous or tomentose.

B. Outer involucre bracts lanceolate to linear-subulate.

c. Margins of lvs. entire or nearly so. 3. *I. glandulosa*

cc. Margins of lvs. toothed. 4. *I. grandiflora*

BB. Outer involucre bracts ovate.

c. Heads in corymbs or racemes.

D. Peduncles long and stout. 5. *I. Helenium*

DD. Peduncles very short or none. 6. *I. racemosa*

CC. Heads solitary.

D. Base of upper lvs. cordate or auriculate. 7. *I. Royleana*

DD. Base of upper lvs. attenuate. 8. *I. macrocephala*

1. *I. ensifolia*, L. Sts. simple, about 2 ft. high, villous beneath the heads: lvs. narrowly linear-lanceolate, with several somewhat parallel nerves, the margins ciliate-serrulate, otherwise glabrous, attenuate to a sessile base: heads 1–2 in. across, yellow, solitary or in small clusters; outer involucre bracts ovate-lanceolate, ciliate, parallel-nerved. Eu., Asia.

2. *I. salicina*, L. Sts. simple or branched above, 1–2½ ft. high, glabrous or slightly hairy below: lvs. oblong-lanceolate, netted-veined, glabrous except nerves beneath and ciliate margins, cordate and clasping at base: heads 1–1½ in. across, golden-yellow, in loose terminal corymbs or sometimes solitary; outer involucre bracts lanceolate, ciliate. Eu., Asia.

3. *I. glandulosa*, Willd. Erect, hairy, the simple sts. leafy to the top, 2½–4 ft. high: lower lvs. oblong-spatulate, long-attenuate at base, the uppermost oblong with subcordate-decurrent base, all entire or very obscurely denticulate and with remote glands at the margin: heads solitary, 3 in. or more across, yellow; involucre bracts lanceolate-subulate, hairy. Caucasus. Var. *laciniata*, Hort., has fringed half-drooping golden-yellow rays.

4. *I. grandiflora*, Willd. Sts. simple, villous, 3–4 ft. high, leafy to top: lvs. elliptic-oblong, serrulate, all sessile, finely villous and with numerous glands, the lower 2–4 in. long: heads solitary, orange-yellow, 3¼–4 in. across; involucre bracts lanceolate to linear-subulate, hairy. Himalayas, Caucasus.

5. *I. Helenium*, L. ELECAMPANE. Sts. 2–6 ft. high, hairy, from thick per. root: lvs. large, unequally dentate-serrate, velvety beneath, hispid-roughened above, the basal elliptic-oblong, to 2 ft. long, narrowed to petiole, st.-lvs. oblong-ovate, cordate-clasping: heads 2–4 in. across, in loose terminal corymbs or sometimes solitary; outer involucre bracts leafy, ovate, pubescent; rays yellow, very many, long and slender. (*Helenium*: of doubtful significance; page 1014; herbalist name.) Eu., N. Asia; nat. N. S. to N. C. and Mo.

6. *I. racemosa*, Hook. f. Sts. 2-5 ft. high, grooved and hairy: basal lvs. to $1\frac{1}{2}$ ft. long, narrowed into petiole; upper lvs. oblong, sessile and clasping, rough above, white-tomentose beneath: heads 2-3 in. across, sessile or very short-peduncled, in the axils of the upper lvs. and forming a raceme; outer involucre bracts ovate, tomentose, recurved at tips; rays very narrow, yellow. Himalayas.

7. *I. Royleana*, DC. Sts. 1-2 ft. high, grooved: lvs. toothed, hairy, often densely tomentose beneath, obtuse, basal ovate or oblong with winged petiole, to 10 in. long, upper lvs. cordate or auriculate at base: heads 3-4 in. across, orange-yellow, solitary on stout hairy peduncles; outer involucre bracts ovate. (J. F. Royle, page 50.) Himalayas.

8. *I. macrocephala*, Kotschy & Boiss. Sometimes included in *I. Royleana*, but differing in upper lvs. attenuate at base. Caucasus.

79. **BUPHTHALMUM**, L. OX-EYE. Per. herbs, of about 4 species in Eu. and W. Asia, grown for the showy yellow heads.—Lvs. alternate, entire or toothed: heads solitary or few and terminal, radiate; involucre bracts imbricated in several series; receptacle chaffy; ray-fls. in 1-2 rows, pistillate, fertile; disk-fls. bisexual and fertile: achenes 3-angled to nearly terete; pappus of scales united into a short crown. (Buphtalum: Greek for *ox* and *eye*.)

A. Lvs. lanceolate, attenuate at base. 1. *B. salicifolium*
AA. Lvs. cordate-ovate. 2. *B. speciosum*

1. *B. salicifolium*, L. Sts. erect, 1-2 ft. high, pubescent: lvs. oblong-lanceolate to lanceolate, attenuate at base, entire or slightly toothed, hairy: heads 1-2 in. across, solitary; involucre silky-hairy, long-pointed. S. Eu.

2. *B. speciosum*, Schreber (*Tekelia speciosa*, Baumg. *B. cordifolium*, Waldst. & Kit.). Sts. erect, 3-6 ft. high, hairy: lvs. toothed, nearly glabrous above, hairy beneath, the lower triangular-cordate and petioled, upper oval or oblong and sessile: heads 2-2½ in. across, usually 2-8 in a corymb; involucre bracts with recurved tips. S. Eu.

80. **AMMOBIUM**, R. Br. Two or 3 Australian species, one grown as an "everlasting."—Per. herbs (ours grown as an ann.), more or less white-tomentose: lvs. alternate or basal: heads solitary at the ends of the branchlets, consisting of disk-fls. only, these yellow, bisexual and fertile, surrounded by an involucre of dry silvery-white bracts and subtended by chaffy scales: achenes 4-angled; pappus of 2-4 teeth, or shortly cristate. (Ammobium: Greek *living in sand*.)

A. *alatatum*, R. Br. WINGED EVERLASTING. Erect, branching, to 3 ft. high, white-woolly, the wool more or less deciduous in age; sts. and branches conspicuously winged (sometimes merely angled): basal lvs. ovate at the ends and long-tapering below (javelin-shaped); st.-lvs. lanceolate, small and distant, entire or nearly so: heads about 1 in. across; involucre bracts ovate, pearly white and petal-like, thickened and greenish at base, fluted and erose at tips. Var. *grandiflorum*, Hort., has fls. to 2 in. across.

81. **HELIPTERUM**, DC. About 48 species, native to S. Afr. and Australia, a few grown as "everlastings" or immortelles.—Mostly herbs, ann. or per., more or less white-tomentose to glabrate: lvs. commonly alternate, entire: heads discoid, of few to many fls., solitary or clustered; fls. bisexual, yellow; involucre bracts in many series, the outer rows scarious or membranaceous, imbricated, the inner (in ours) mostly expanded and petal-like, white, yellow or rose-color, with thickened greenish or brownish basal portion: achenes in ours densely silky-hairy; pappus-bristles plumose. (Helipterum: Greek for *sun* and *wing*; said to refer to the light-plumed pappus.)

A. Heads 1-2 in. across, solitary or in loose clusters of 2 or 3: plant glabrous.

B. Lvs. broad: peduncles with scarious bracts. 1. *H. Manglesii*

BB. Lvs. linear or spatulate-linear: peduncles without scarious bracts. 2. *H. roseum*

AA. Heads about ½ in. across, in rather close clusters of several to many: plant somewhat woolly. 3. *H. Humboldtianum*

1. *H. Manglesii*, Muell. (*Rhodanthe Manglesii*, Lindl.). Glabrous glaucous ann. 1-1½ ft. high, with slender somewhat tortuous branches: lvs. thin, elliptic or ovate, entire, strongly clasping at base: heads showy, 1-1½ in. across, solitary or loosely clustered, nodding, on slender stalks, these bracteate, the bracts passing into those of the involucre; involucre consisting of several outer series of loosely imbricated ovate bracts which are silvery-scarious except at base, and of 2-3 series of inner bracts resembling ray-fls., clear pink varying to white or to dark red. (Named after James Mangles, an English naturalist, died 1867.) Australia. Var. *maculatum*, Hort. (*Rhodanthe maculata*, Drumm.), has bracts flecked with red.

2. *H. roseum*, Benth. (*Acroclinium roseum*, Hook. *Roccardia rosea*, Voss). Glabrous ann., 1-2 ft. high, with many strict simple branches from near the base: lvs. numerous, linear, spatulate-linear or the upper lanceolate: heads 1-2 in. across, on short naked (or nearly so) peduncles, terminating the branches; involucre bracts of the outer rows ovate to oblong with brownish scarious tips, those of the inner rows much enlarged and petaloid, pink or white with thickened brownish or greenish basal portion. Australia.

3. *H. Humboldtianum*, DC. (*H. Sandfordii*, Hook.). Ann. (or cult. as such), 1-1½ ft. high, erect, or with a decumbent base, white-tomentose at least when young: lvs. linear or oblanceolate-linear, somewhat clasping: heads about ½ in. across, obconic, in a dense terminal corymb; outer involucre bracts in many series, brownish-scarious, imbricated, the inner 1-2 series with short spreading yellowish-green tips. (Named after Alex. von Humboldt, page 45.) Australia.

82. **HELICHRYSUM**, Gaertn. Species about 350 in Eu., Asia, Afr. and Australia, a few grown for ornament.—Herbs or shrubs, commonly somewhat tomentose: lvs. alternate or the lower rarely opposite, entire: heads discoid, solitary or clustered at the ends of the branches; involucre bracts in many rows, imbricated and scarious or membranaceous, the inner often enlarged and white or gaily colored, petaloid, with thickened brownish bases; fls. yellow: pappus of bristles simple or plumose only at tip. (*Helichrysum*: Greek for *sun* and *gold*, referring to the fl.-heads.)

- A. Heads solitary.
- B. Lvs. 2-5 in. long, green and glabrous.....1. *H. bracteatum*
- BB. Lvs. ¼-½ in. long, white-woolly beneath.....2. *H. bellidioides*
- AA. Heads in corymbs.....3. *H. petiolum*

1. *H. bracteatum*, Andr. STRAWFLOWER. Stout ann., 1½-3 ft. high, somewhat branched, minutely scabrous-roughened: lvs. rather numerous, oblong-lanceolate, 2-5 in. long, tapering to short petiole, glabrous or nearly so: heads solitary, 1-2½ in. across; outer involucre bracts short and obtuse, imbricated, those of the inner rows elongated and petaloid, yellow, orange, red or white, with thickened greenish basal portion. Australia. Var. *monstrosum*, Hort. (*H. monstrosum*, Hort.), has larger heads with more numerous petaloid bracts.—Frequently grown as an "everlasting."

2. *H. bellidioides*, Willd. Per. with trailing sts. 6-18 in. long and erect or ascending leafy branches: lvs. obovate, ¼-½ in. long, white-woolly beneath, green above: heads ½-¾ in. across, solitary on bracteate tomentose peduncles 1-5 in. long; involucre bracts tomentose at base, the long tips silvery-white and radiating. New Zeal.

3. *H. petiolum*, DC. (*Gnaphalium petiolum*, L. *G. lanatum*, Hort.). Somewhat shrubby at base, the sts. woolly, to 2 ft. or more: lvs. ovate, to 1 in. long, abruptly petiolate, very woolly: heads about ½ in. across, in corymbs 1-2 in. across; involucre bracts oblong, obtuse, cream-white. S. Afr.—Grown under glass and in the open for its vine-like shoots that cover rocks or hang from baskets.

83. **ANTENNARIA**, Gaertn. EVERLASTING. PUSSYS-TOES. Woolly per. dioecious herbs, of about 50 widely distributed species, a few grown in rock-gardens.—Lvs. mostly basal, or alternate on the st.: heads small, in clusters or corymbs, of disk-fls. only; involucre bracts imbricated in several series, the inner membranous and white or colored; receptacle not chaffy: pappus of staminate fls. thickened above, of pistillate fls. of capillary bristles slightly united at base. (*Antennaria*: from the resemblance of pappus to antennæ.)

- A. Lvs. permanently white-tomentose above.....1. *A. rosea*
- AA. Lvs. becoming green and glabrous or nearly so above.
- B. Involucre bracts usually rose, obtuse: achenes glabrous.....2. *A. dioica*
- BB. Involucre bracts white, acute or acuminate: achenes papillose.....3. *A. neodioica*

1. *A. rosea*, Greene (*A. dioica* var. *rosea*, A. Eaton). Stoloniferous, 8-16 in. high: lvs. oblanceolate, ½-¾ in. long, permanently white-tomentose on both sides: heads about ½ in. long, short-peduncled, in rounded compound clusters; involucre woolly at base, tips of bracts pink to rose: achenes glabrous. Alaska to Calif. and Colo.

2. *A. dioica*, Gaertn. (*Gnaphalium dioicum*, L. *A. insularis*, Greene). Stoloniferous, 3-12 in. high: lvs. spatulate, to 1 in. long, white-tomentose beneath, becoming green and nearly glabrous above: heads about ¼ in. long, peduncled, in compound clusters; involucre woolly at base, tips of bracts white or pink: achenes glabrous. Eu., Asia, Aleutian Isls.

3. *A. neodioica*, Greene (*A. neglecta* var. *attenuata*, Cronquist in part). Differs from *A. dioica* in the broader roundish lvs. abruptly narrowed at base, and the narrower prevailingly acute or acuminate white involucre bracts: achenes papillose. Newf. to Va. and S. D.

84. **ANAPHALIS**, DC. White-woolly per. dioecious herbs, of about 35 species in the north temp. zone, useful for the rock-garden.—Sts. leafy, erect: lvs. alternate,

entire, sessile: heads in small corymbs, of disk-fls. only; involucre bracts imbricated in several series, usually white; receptacle not chaffy: pappus of slender bristles. (Anaph-alis: from old Greek name.)

A. margaritacea, Gray (*Gnaphalium margaritaceum*, L. *Antennaria margaritacea*, Hook.). PEARL EVERLASTING. Sts. 1-3 ft. high, woolly, branched above: lvs. linear-lanceolate, 3-5 in. long, revolute, green and pubescent above, white-tomentose beneath: heads about $\frac{1}{4}$ in. across, short-peduncled or sessile; involucre bracts white, usually glabrous. N. Amer., Eu., N. Asia.

85. MIKANIA, Willd. American herbaceous or shrubby climbers, of about 150 species.—Lvs. opposite, petioled: heads small, usually of 4 disk-fls., borne in paniced cymes; involucre of 4 nearly equal narrow bracts; receptacle naked: achenes 5-angled; pappus of capillary bristles. (Mika-nia: named for Joseph Gottfried Mikan, 1743-1814, professor at Prague.)

M. scandens, Willd. (*Eupatorium scandens*, L.). CLIMBING HEMPWEED. Glabrous herbaceous twiner to 15 ft.: lvs. ovate or hastate, 2-4 in. long, deeply cordate at base, long-acuminate, slightly dentate, slender-petioled: heads about $\frac{1}{4}$ in. long, white or pink, in terminal compound clusters. Me. to Fla. and Tex.

86. LIATRIS, Schreber (*Laciniaria*, Hill, an older but rejected name). BLAZING STAR. GAYFEATHER. BUTTON SNAKE-ROOT. Per. herbs of strict habit, of about 40 N. American species.—Roots thick, often tuberous: lvs. alternate, entire, narrow: heads in spikes or racemes in late summer and autumn, rose-purple or white, of disk-fls. only; involucre bracts imbricated in several series; receptacle naked: achenes 10-ribbed; pappus of bristles. (Lia-tris: name of unknown derivation.)—A difficult group, complicated by the hybridizing of some of the species.

- A. Pappus-bristles very plumose to the naked eye.
- B. Inner bracts much longer than fls., with petal-like tips.....1. *L. elegans*
- BB. Inner bracts shorter than fls., not petal-like.....2. *L. punctata*
- AA. Pappus-bristles barbellate (sometimes plumose as viewed under a lens).
- B. Heads oblong, $\frac{1}{4}$ - $\frac{1}{2}$ in. across, in dense spikes.
- C. Rachis of spike pubescent: involucre bracts acuminate.....3. *L. pycnostachya*
- CC. Rachis of spike glabrous: involucre bracts prevailing obtuse.....4. *L. spicata*
- BB. Heads hemispherical, $\frac{1}{2}$ -1 in. across, in interrupted racemes.
- C. Involucre bracts with narrow entire scarious borders.....5. *L. scariosa*
- CC. Involucre bracts with broad lacerate scarious borders.....6. *L. ligulistylis*

1. **L. elegans**, Willd. (*Stoepelia elegans*, Walt. *Laciniaria elegans*, Kuntze). Pubescent, 2-3 ft. high: lvs. linear, 1-6 in. long and $\frac{1}{2}$ - $\frac{1}{4}$ in. wide, very punctate: heads about $\frac{1}{2}$ in. long, of 4-5 purple fls., in spikes or racemes to $1\frac{1}{2}$ ft. long; involucre bracts pubescent, the inner with petal-like acuminate rose-colored tips much longer than fls.: pappus very plumose. Va. to Fla. and Tex.

2. **L. punctata**, Hook. (*Laciniaria punctata*, Kuntze). Nearly glabrous, 1-2 $\frac{1}{2}$ ft. high: lvs. linear, 2-6 in. long and $\frac{1}{2}$ - $\frac{1}{4}$ in. wide, stiff, very punctate, ciliate on margins: heads $\frac{1}{2}$ - $\frac{3}{4}$ in. long, of 3-6 purple fls., sessile in dense spikes 4-8 in. long which are leafy below; involucre bracts ciliate, acuminate or cuspidate: pappus very plumose. Man. to New Mex.

3. **L. pycnostachya**, Michx. (*Laciniaria pycnostachya*, Kuntze). Very leafy, 2-5 ft. high, pubescent above: lvs. linear-lanceolate, the lower to 1 ft. long and $\frac{1}{2}$ in. wide, upper smaller, punctate: heads about $\frac{1}{2}$ in. long, of 3-6 purple fls., in dense spikes 6-18 in. long having a pubescent rachis; involucre bracts pubescent, with acuminate purplish tips: pappus barbellate. Wis. to La. and Tex.

4. **L. spicata**, Willd. (*Serratula spicata*, L. *Laciniaria spicata*, Kuntze). Glabrous or nearly so, 1-6 ft. high: lvs. linear, the lower to 1 ft. long and $\frac{1}{2}$ in. wide, somewhat punctate: heads $\frac{1}{4}$ - $\frac{1}{2}$ in. across, of 5-13 blue-purple fls. (or white in var. *alba*), in dense spikes to 15 in. long; involucre bracts mostly obtuse, glabrous: pappus barbellate. Mass. to Fla. and La.—The plant known to cult. as *L. callilepis* belongs here.

5. **L. scariosa**, Willd. (*Serratula scariosa*, L. *Laciniaria scariosa*, Hill). Glabrous or pubescent, 1-3 ft. high: lower lvs. broad-lanceolate, to 5 in. long and 1 in. wide, with petioles to 4 in. long, the upper much smaller, punctate: heads hemispherical, $\frac{1}{2}$ -1 in. across, of 28-40 bluish-purple fls. (a white var. *alba* listed), peduncled, in interrupted racemes; involucre bracts glabrous or slightly pubescent, obtuse, with narrow entire scarious borders: pappus barbellate. S. Pa. to Ga.

6. **L. ligulistylis**, Schum. (*Laciniaria ligulistylis*, A. Nels.). Differs from *L. scariosa* in the somewhat larger heads of 30-106 fls., the glabrous involucre bracts with broad lacerate scarious borders. Wis. to Wyo. and New Mex.

87. EUPATORIUM, L. THOROUGHWORT. BONESET. At least 600 species, chiefly of Mex., the W. Indies and trop. S. Amer., yielding good greenhouse plants and also subjects for the hardy border.—Per. herbs, a few species ann., many of the trop. ones shrubby or even arborescent: lvs. mostly opposite: heads rayless, mostly in dense flat-topped or rounded clusters, less frequently in open panicles; involucre cylindric to hemispherical, its bracts in 2 to many overlapping ranks; fls. bisexual, 5 or more (rarely 1-4) in each head, purple, rose-colored or white, more rarely lilac or bluish-violet, never yellow; style-branches long, thread-like or club-shaped, protruding far out of the corolla-tube: achenes 5-angled, crowned with a well-developed pappus of hair-like bristles. (Eupato-rium: named for an ancient king of Pontus, said by Pliny to have employed one of this group of plants in medicine.)

- A. Base of lvs. connate around st. 1. *E. perfoliatum*
 AA. Base of lvs. petioled.
 B. Lvs. in whorls of 3-6.
 C. Sts. usually not mottled, glaucous, hollow: heads 6-7-fld. 2. *E. purpureum*
 CC. Sts. mottled, solid, not glaucous: heads 9-15-fld. 3. *E. maculatum*
 BB. Lvs. in pairs or rarely alternate.
 C. Fls. pink, blue or lilac.
 D. Sts. glabrous 4. *E. glabratum*
 DD. Sts. pubescent.
 E. Plant a shrub; sts. with reddish pubescence. 5. *E. sordidum*
 EE. Plant herbaceous; pubescence not reddish.
 F. Shape of lvs. oblong-lanceolate, narrowed at base. 6. *E. Lasseeauxii*
 FF. Shape of lvs. triangular-ovate, truncate or broad at base. 7. *E. celestinum*
 CC. Fls. white (pappus sometimes colored).
 D. Shape of lvs. ovate, truncate or broad at base.
 E. Margins of lvs. with large sharp teeth. 8. *E. rugosum*
 EE. Margins of lvs. with shallow blunt teeth.
 F. Pubescence glandular 9. *E. glandulosum*
 FF. Pubescence not glandular. 10. *E. vernale*
 DD. Shape of lvs. oblong to lanceolate, cuneate at base.
 E. Margins of lvs. entire or with few teeth.
 F. Heads 4-8-fld. 11. *E. ligustrinum*
 FF. Heads 15-18-fld. 4. *E. glabratum*
 EE. Margins of lvs. conspicuously toothed.
 F. Pubescence dense and glandular. 6. *E. Lasseeauxii*
 FF. Pubescence sparse and not glandular. 12. *E. riparium*

1. *E. perfoliatum*, L. Pubescent per. 2-5 ft. high, branched above: lvs. lanceolate, 4-8 in. long, the pairs united at base around the st., long-acuminate, fine-toothed, rugose: heads of 10-16 white or rarely blue fls., in crowded corymbs. N. B. to Fla. and Tex.

2. *E. purpureum*, L. JOE-PYE WEED. Per. 3-10 ft. high, the sts. hollow, glaucous and glabrous, uniformly purplish or rarely mottled: lvs. 4-6 in a whorl, elliptic-lanceolate, 4-12 in. long, acuminate, tapering at base, coarsely toothed, glabrous except on veins beneath: heads of 6-7 purple fls. in a loose convex infl. Me. to Fla. and Tex.

3. *E. maculatum*, L. JOE-PYE WEED. Differs from *E. purpureum* in the solid not glaucous sts. which are mottled with purple, lvs. usually 4-5 in a whorl, elliptic-ovate or lanceolate, infl. dense and flat-topped, heads 9-15-fld. Newf. to Pa. west to B. C. and New Mex.

4. *E. glabratum*, HBK. Shrub 3-8 ft. high, erect, with slender hard glabrous brown sts.: lvs. lance-oblong or ovate-oblong, 1-2½ in. long, tapering into a strong petiole, blunt or pointed, entire or small-toothed: heads of 15-18 pale pink fls. in ascending cymose clusters, together forming a long terminal leafy panicle. Mex.

5. *E. sordidum*, Less. (*E. ianthinum*, Hemsl.). Shrub to 6 ft. or more, the sts., at least when young, densely reddish-tomentose: lvs. ovate or ovate-oblong, 3-4 in. long and 2-3 in. wide, short-acuminate, toothed, on petioles 1-2 in. long: heads of many fragrant violet fls. in dense convex corymbs. Mex.

6. *E. Lasseeauxii*, Carr. (*Ageratum Lasseeauxii*, Carr.). Per. 1-2 ft. high, densely covered with short glandular hairs: lvs. alternate above, oblong-lanceolate, narrowed at each end, bluntly toothed: heads in small compact unequal stalked clusters; fls. very numerous, at first white, at maturity vivid rose-color. (Named after M. Lasseeaux, who first sent the seeds to France.) Temp. S. Amer.

7. *E. celestinum*, L. (*Conoclinium celestinum*, DC.). MIST-FLOWER. Per. 1-3 ft. high, branching and somewhat pubescent: lvs. triangular-ovate, 1½-3 in. long, obtuse or acute, truncate or abruptly contracted at base, coarsely toothed: heads in compact clusters, many-fld., light blue to violet, Aug.-Oct. N. J. to Fla. and Tex.

8. *E. rugosum*, Houtt. (*E. urticæfolium*, Reichard. *E. ageratoides*, L. f.). WHITE SNAKE-ROOT. Smoothish branching herb 2-4 ft. high, glabrous or pubescent: lvs. ovate, 3-6 in. long, acuminate, truncate or broad at base, coarsely and sharply serrate, green on both sides: heads in loose but ample clusters, of 5-8 bright white fls., July-Sept. Que. to Fla. and La.—Sometimes in the trade as *E. ageratoides* or *Ageratum Frasert.*

9. *E. glandulosum*, HBK. Diffuse and often decumbent herb, the slender round branches, petioles, and pedicels finely glandular-puberulent: lvs. triangular-ovate or rhombic-ovate, slender-petioled, taper-pointed, coarsely and sometimes unevenly crenate-dentate, sparingly puberulent beneath: heads pure white, ageratum-like, in close clusters, late autumn and early winter. Mex.

10. *E. vernale*, Vatke & Kurtz. Strong herb, slightly woody in the wild, with hairy sts.: lvs. oblong-ovate, 3-5 in. long, long-petioled, taper-pointed, serrate, finely hairy above, paler and grayish velvety beneath, veiny: heads in an ample terminal corymb, fls. bright white, Sept. Mex.

11. *E. ligustrinum*, DC. (*E. micranthum*, Lag. *E. Weinmannianum*, Regel & Koern.). Upright shrub 4-15 ft. high: lvs. oblong, 2-3½ in. long, acuminate, the blade somewhat toothed and slightly decurrent in narrow crisped wings on the short petiole, glandular beneath: heads of 4-8 white fls., very numerous in a large round-topped terminal corymb; pappus pink-tinged to deep rose. Mex.

12. *E. riparium*, Regel. Diffuse, becoming woody at base, 2 ft. high, sts. slender, puberulent and usually reddish: lvs. long lance-shaped, 2-4 in. long, taper-pointed and at base narrowed to a petiole, prominently 3-ribbed, serrate: heads of 20 or more white fls., in rather compact long-stalked clusters. Mex.

88. **AGERATUM**, L. Mostly trop. American herbs, of about 30 species, two frequently cult. in fl.-gardens and blooming all summer.—Herbs or shrubs, ours ann., mostly loose-growing, 1-2 ft. high, with compact dwarf and variegated forms: lvs. mostly opposite, ovate, crenate-serrate, petiolate: heads tassel-like, clustered; involueral bracts narrow, subequal, in 2-3 series; receptacle naked or with scales; fls. all tubular, blue (rarely pink) or white; anthers appendaged: achenes 5-angled; pappus of separate or united scales. (Ager-atum: Greek *not growing old*, first applied to some everlasting.)

- A. Involueral bracts sparingly if at all hairy on back: lvs. commonly blunt or rounded at base. 1. *A. conyzoides*
 AA. Involueral bracts densely and somewhat viscidly hairy on back: lvs. commonly heart-shaped at base. 2. *A. Houstonianum*

1. *A. conyzoides*, L. Lvs. blunt or rounded at base, rarely heart-shaped: heads seldom ¼ in. across; fls. blue or white; involueral bracts oblong, abruptly acuminate, sparingly if at all hairy on the back, erose and ciliate. Tropics.

2. *A. Houstonianum*, Mill. (*A. mexicanum*, Sims). Lvs. usually heart-shaped at base: heads commonly a little more than ¼ in. across; fls. blue; involueral bracts lance-linear, attenuate, entire, ciliate, the back finely, densely, and somewhat viscidly hairy. (Named after Wm. Houston, American physician who collected plants in the Antilles and Mex., died 1733.) Mex.

89. **PIQUERIA**, Cav. Trop. American shrubs or seldom herbs, of about 20 species, one common under glass.—Lvs. opposite, entire or toothed: heads small, thickly clustered; involuere campanulate, the bracts in 2 series; anthers not appendaged at apex: achenes 4-5-angled; pappus none or very short. (Pique-ria: A. Piquerio, Spanish physician of 18th century.)

P. trinervia, Cav. (*Stevia serrata*, Hort. not Cav.). Per. to about 3 ft. high: lvs. lanceolate to oblong-lanceolate, 1-3 in. long, serrate-dentate, in one var. broadly white-edged: heads small, 3-5-fld., borne in small paniced corymbs, each cluster terminating a slender axillary branch or peduncle; fls. tubular, whitish, fragrant, flowering till frost or in green-houses winter-blooming. Mex., Cent. Amer., Haiti.

90. **ARCTIUM**, L. (*Lappa*, Juss.). BURDOCK. About a half dozen species of very coarse rank-smelling large-lvd. bur-bearing biennials or short-lived perennials, scarcely known as ornamentals but of medicinal reputation and one sometimes grown for its edible roots; native in Eu. and Asia, some widely distributed as rank weeds of yards and neglected places.—Lvs. alternate, tomentose or soft-pubescent at least beneath, cordate and undivided: heads many and clustered, the fls. all tubular and little projecting from the tight globose or urceolate involuere, the bracts of which are produced into long hooked tips so that the whole head becomes a bur; fls. bisexual, purple to nearly white; receptacle setose: achenes oblong and somewhat compressed, more or less 3-angled; pappus of short serrulate deciduous scales. (Arc-tium: Greek *bur*, probably from the bur-like involuere.)

- A. Bracts of involucre flat, straight and spreading, all equalling the fls.: heads usually exceeding 1 in. diam. 1. *A. Lappa*
 AA. Bracts angled or very narrow, curving and less spreading, at least the inner ones shorter than the fls.: heads usually less than 1 in. diam. 2. *A. minus*

1. **A. Lappa**, L. (*Lappa major*, Gaertn. *L. edulis*, Sieb.). GREAT BURDOCK. GOBO of the Japanese. Very stout, much-branched, to 8 ft., a frequent weed, but to be looked for as a cult. plant with the Japanese, the straight young roots esteemed as a vegetable when the plant is a few months old and the roots 10–15 in. long and $\frac{1}{2}$ in. or less thick or in larger sizes 2 ft. long and 1 in. thick at top: lower lvs. broadly cordate-ovate and obtuse, the blade sometimes 20 in. and more long, canescent or floccose-tomentose beneath: heads about $1\frac{1}{2}$ in. broad with the spread of the bracts, aggregate into flat-topped or corymb-like clusters. (*Lappa*: an ante-Linnæan name, signifying the clinging nature of the burs.)—The plant is handled essentially as an ann. in Japan, seed of early vars. sown in May and roots taken in autumn, of late vars. sown in Aug. and roots taken in spring.

2. **A. minus**, Schk. (*Lappa minor*, DC.). COMMON BURDOCK. Smaller than no. 1, 3–4 ft. or to 6 ft. in cult.: lvs. similar but smaller: heads usually about $\frac{3}{4}$ in. broad with the less spreading or not reflexed curved narrow bracts, placed along the branches in a racemose order. A common weed and sometimes grown for medicinal purposes.

91. XERANTHEMUM, L. Ann. herbs of the Medit. region, about 6 species, one grown in the fl.-garden.—Densely pubescent or tomentose, with branching leafy sts.: lvs. alternate, narrow, entire, not spinose: heads solitary on long naked peduncles; outer involucre bracts well-imbricated, the inner elongate, petal-like, papery and persistent; receptacle chaffy; outer fls. few and sterile, inner ones fertile: achenes silky-hairy; pappus a single row of pointed scales. (*Xeran-themum*: Greek *dry flower*; one of the everlastings.)

X. annuum, L. COMMON IMMORTELE. Erect, branching, 2–3 ft. high, white-tomentose: lvs. oblong to oblong-lanceolate, sharply acute, $\frac{1}{2}$ –2 in. long: heads $1\frac{1}{2}$ in. across, the purple or rose shining inner involucre bracts twice as long as disk, Aug. S. Eu.—One of the oldest and best-known of the “everlastings.” Runs into many vars. differing in size and color of heads.

92. CENTAUREA, L. A prominent genus of some 500 species mostly in the Old World, many cult. for the fls.—Ann. or per. herbs, rarely somewhat shrubby, with alternate entire or pinnately lobed or divided lvs.: heads rather small to very large, solitary or panicled; involucre ovoid or globose, the bracts often appendaged and fringed, sometimes prickly; receptacle bristly; fls. purple, blue, yellow or white, the marginal ones sometimes sterile and elongated, making the head look as if rayed: pappus of bristles or scales or none. (*Centaure-a*: a *centaur*, famous for healing.)

- A. Bracts of involucre and their appendages entire.
 B. Plant tomentose: involucre bracts with recurved spiny tips. 1. *C. babylonica*
 BB. Plant glabrous: involucre bracts not spine-tipped.
 C. Pappus uniform, equalling the hairy achene: plant ann. 2. *C. moschata*
 CC. Pappus unequal, about one-third length of glabrous achene: plant per. 3. *C. ruthenica*
 AA. Bracts of involucre or their appendages fringed or ciliate.
 B. Lvs. entire or merely toothed.
 C. Fls. yellow, the marginal ones similar to interior fls. 4. *C. macrocephala*
 CC. Fls. rose, blue or purple to white, never yellow, the marginal ones enlarged and ray-like.
 D. Heads 3–5 in. across: plant rough but nearly glabrous. 5. *C. americana*
 DD. Heads $1\frac{1}{4}$ – $2\frac{1}{4}$ in. across: plant pubescent, at least when young.
 E. Plant ann.: lvs. linear. 6. *C. Cyanus*
 EE. Plant per.: lvs. broad-lanceolate. 7. *C. montana*
 BB. Lvs. pinnatifid.
 C. Foliage white-tomentose throughout.
 D. Fls. yellow. 8. *C. ragusina*
 DD. Fls. pink to purple.
 E. Pappus about length of achene. 9. *C. Cineraria*
 EE. Pappus none. 10. *C. gymnocarpa*
 CC. Foliage white-tomentose only beneath if at all.
 D. Under surface of lvs. green. 11. *C. Scabiosa*
 DD. Under surface of lvs. white- or gray-tomentose.
 E. Pappus short and caducous, not plumose: flowering sts. branching. 12. *C. dealbata*
 EE. Pappus longer than achene, persistent, somewhat plumose: flowering sts. not branching. 13. *C. pulcherrima*

1. **C. babylonica**, L. Stiff per. 4–12 ft. high, covered with white webby tomentum: basal lvs. lyrate, to 2 ft. long and 10 in. wide, petioled; st.-lvs. long-decurrent, oblong to lanceolate, acuminate, entire or wavy: heads yellow, $1\frac{1}{2}$ in. long, nearly sessile, in a long narrow panicle; bracts of involucre entire, with recurved spiny tips: pappus white, equaling the achenes. Asia Minor.

2. *C. moschata*, L. (*C. suaveolens*, L. *C. odorata*, Hort. *Amberboa moschata*, Boiss.). SWEET SULTAN. Green glabrous ann., erect, branching below, to 2 ft.: lvs. toothed or pinnatifid and the lobes dentate: fls. white, yellow or purple, fragrant, in long-peduncled solitary heads 2 in. across, the marginal fls. enlarged; bracts of involucre entire, the innermost with scarios margins: pappus equalling the hairy achene. Orient.—*C. imperialis*, Hort., is a variant or hybrid of this species.

3. *C. ruthenica*, Lam. Glabrous erect branching per. 3 ft. high: lvs. pinnatisect into linear-toothed lobes, sharply narrowed at both ends, the base often somewhat decurrent; heads usually solitary, 2 in. across, long-peduncled, the pale yellow marginal fls. about $\frac{3}{4}$ in. long; bracts of involucre entire: pappus reddish, about one-third length of glabrous achene. Eu., W. Asia.

4. *C. macrocephala*, Puschk. Erect per. $2\frac{1}{2}$ –3 ft. high, the simple leafy sts. swollen below the fl.-head: lvs. ovate-lanceolate, slightly decurrent, the basal short-petioled, acute, somewhat serrate, scabrous, gradually diminishing upward to the base of the single terminal head: heads subglobose, often 3–4 in. diam.; fls. yellow, all alike; involucre of 8–12 rows of appressed scarios-margined fringed rusty bracts: pappus shorter than achene. Armenia.

5. *C. americana*, Nutt. BASKET-FLOWER. Nearly glabrous roughish ann., sts. stout, simple or nearly so, 2–6 ft., thickened under the naked solitary head: lvs. mostly entire, oblong-lanceolate, 2–5 in. long, sessile or lower petioled, mucronate: heads 3–5 in. across; fls. rose- or flesh-colored, sometimes purplish (white in var. *alba*, Hort.), the bisexual ones forming a disk 1–3 in. diam., the neutral enlarged outer ones with narrow lobes often 1 in. long; bracts of involucre with fringed scarios appendages: pappus longer than achene. Mo. to La. and Mex.

6. *C. Cyanus*, L. CORNFLOWER. BACHELORS-BUTTON. BLUE-BOTTLE. Slender branching ann. 1–2 ft. high, woolly-white at least when young: lvs. linear, 3–6 in. long, entire or the lower toothed, sometimes pinnatifid: heads naked on slender peduncles, $1\frac{1}{2}$ in. across; fls. blue, purple, pink or white, the marginal ones enlarged and ray-like; involucre bracts rather narrow, fringed with short scarios or blackish teeth: pappus about equalling achene. (*Cyanus*: Greek *blue*; herbalist name.) S. E. Eu., escaped in N. Amer.

7. *C. montana*, L. MOUNTAIN BLUET. Per. 12–16, rarely 20 in. high, sts. usually unbranched, often stoloniferous: lvs. broad-lanceolate or obovate-oblancoate, toothed, decurrent, the younger ones silvery-white: heads solitary on short peduncles, $1\frac{1}{2}$ in. across; fls. blue (white in var. *alba*, Hort.), the marginal ones to 1 in. long; involucre bracts with black fringed margins: pappus short. Eu.

8. *C. ragusina*, L. White-tomentose per. 1–3 ft. high, sts. usually simple and naked above: lvs. pinnatifid or lyrate-pinnatifid into ovate obtuse entire or pinnately lobed segms., the lower long-petioled: heads solitary or rarely 2–3, $1\frac{1}{2}$ in. across; fls. bright yellow, the marginal ones not spreading; involucre with small reddish or black ciliate appendages with a short terminal spine; pappus white, about length of achene. (Named for Ragusa.) Dalmatia.—Grown in Calif.

9. *C. Cineraria*, L. (*C. candidissima*, Lam.). DUSTY MILLER. Erect branching per. 1 ft. or more high, the entire plant white-tomentose: lvs. pinnately parted into broad very obtuse lobes, the lower petioled, all the lobes linear-lanceolate, obtuse; heads rather large; fls. purple, the marginal slightly enlarged; bracts of involucre with a membranaceous black margin, long-ciliate, the apical bristle thicker than the others: pappus about equalling achene. (*Cineraria*: Latin *ashy*, referring to the color of the foliage; adopted from herbalist sources.) S. Eu.—The plant usually grown as *C. candidissima* is *Senecio leucostachys*.

10. *C. gymnocarpa*, Moris & de Not. DUSTY MILLER. Erect per. 1–3 ft. high, covered throughout with felt-like white tomentum: lvs. pinnately or usually bipinnately cut into linear or oblong obtuse entire segms., the lower petioled: heads solitary or few at tips of branches; fls. rose-violet or purple; bracts of involucre reddish, at tips short-ciliate: achene puberulous, without pappus, the scales of the receptacle capillary and longer than achene. Capri.—Most of the material passing as *C. gymnocarpa* is referable to *C. Cineraria*.

11. *C. Scabiosa*, L. Pubescent per. to 2 ft.: lvs. pinnatisect, to 6 in. long, petioled, the upper smaller and sessile: heads about 2 in. across, solitary on bracted peduncles; fls. purple, the marginal ones enlarged; involucre bracts fringed and black-margined: pappus equalling achene. (*Scabiosa*: genus in Dipsacæ.) Eu.; nat. in N. Amer.

12. *C. dealbata*, Willd. (*Psephellus dealbatus*, Boiss.). Suberect per. 8–24 in. high: lvs. white-tomentose beneath, glabrous above, the lower ones $1\frac{1}{2}$ ft. long, petioled, pinnate, the obovate lobes coarsely cut-toothed or auricled at base; st.-lvs. mostly sessile, pinnately divided, with oblong-lanceolate decurrent lobes: heads solitary, just above the uppermost lf., 2 in. or more across; inner fls. red, marginal ones rosy or white; involucre bracts deeply fringed and ciliate: pappus short and caducous. Asia Minor, Iran.

13. *C. pulcherrima*, Willd. (*Ætheopappus pulcherrimus*, Boiss.). Per. to $2\frac{1}{2}$ ft.: lvs. pinnatisect or toothed, to 7 in. long, glabrous above, gray-tomentose beneath, petioled: heads solitary, about 2 in. across; fls. purple, marginal ones enlarged; involucre bracts papery, fringed, brown, the lower white: pappus reddish, somewhat plumose, longer than achene. Caucasus.

93. **CARTHAMUS**, L. Species about 20, from the Canary Is. to Cent. Asia, one cult. for the fls. which have various economic uses, as the yielding of dye; also ornamental.—Annuals with alternate spiny lvs.: heads terminal, solitary or corymbose; involucre with spreading leafy outer bracts and more or less spiny inner ones; receptacle chaffy; corolla 5-fid, nearly regular, expanded above the tube: achenes glabrous, mostly 4-ribbed, the pappus none or scale-like. (*Car-thamus*: Arabic name, alluding to a color yielded by the fls.)

C. tinctorius, L. **SAFFLOWER. FALSE SAFFRON.** One to 3 ft. high, glabrous, branched above: lvs. oblong or ovate-lanceolate, the upper clasping, minutely spinose-toothed: heads 1-1½ in. across, surrounded by a cluster of leafy bracts which pass over gradually into the bracts of the involucre; inner bracts of involucre spine-tipped; fls. orange-yellow: achenes white and shining, ¼ in. long. Eu., Asia.

94. **ECHINOPS**, L. **GLOBE THISTLE.** Nearly 100 species from Spain and Portugal to Cent. Asia and Afr., grown for their foliage and large prickly heads.—Coarse thistle-like herbs, ours per., with sts. and lower surfaces of lvs. more or less white-woolly: lvs. alternate, usually pinnately toothed or 2-3-pinnatisect, the teeth and lobes prickly: fls. solitary, each with a little involucre of its own consisting of bristle-like outer bracts and linear or lanceolate inner bracts which are free or united, all aggregated into a dense spherical head subtended by a small reflexed involucre: achenes elongate, 4-angled or nearly terete, usually villous, crowned by an inconspicuous pappus of many short scales. (*Echi-nops*: Greek *like a hedge-hog*, alluding to the spiny involucre bracts.)

A. Plant glandular: inner involucre bracts pubescent on back.....1. *E. sphærocephalus*
AA. Plant not glandular: inner involucre bracts glabrous on back.

B. Lvs. cobwebby-pubescent above2. *E. humilis*

BB. Lvs. not cobwebby-pubescent above.

c. Upper surface of lvs. glabrous and not setulose: sts. 1-2 ft. high.3. *E. Ritro*

cc. Upper surface of lvs. rough and setulose: sts. 3-12 ft. high.....4. *E. exaltatus*

1. ***E. sphærocephalus***, L. Bushy per. 3-8 ft. high, the forked sts. and fl.-stalks gray-woolly and glandular-sticky: lvs. sinuate-pinnatifid into oblong-triangular spinose-dentate lobes, the upper surface green and roughish with glandular pubescence, the lower surface white-tomentose or arachnoid: heads about 2 in. across, blue or whitish; outer bristle-like bracts of individual fls. about one-half as long as the inner which are fimbriate at the middle, oblong contracted to a point, and with the back pubescent: achenes gray-silky-hairy; pappus of ciliate scales united to middle. Eu. to Siberia.—Apparently not in cult.; see *E. exaltatus*.

2. ***E. humilis***, Bieb. Per. 3-4 ft. high, with simple one-headed sts.: lvs. cobwebby-pubescent above, white-tomentose beneath, the lower sinuate-lyrate and nearly spineless, the upper oblong and spiny-toothed and pinnatifid: outer bristle-like bracts of fls. half as long as the inner ciliate bracts which are glabrous on back: pappus of scarcely ciliate scales united at base. Siberia.

3 ***E. Ritro***, L. Per. 1-2 ft. high, without glands, sts. usually unbranched, white-tomentose: lvs. 1-2-pinnatifid into lanceolate spinose-toothed segms., the upper surface nearly glabrous, the lower densely gray-tomentose: outer bristle-like bracts of the fls. one-third to one-fourth as long as the broad keeled bristly-ciliate and spinose-tipped bluish inner ones in which the back is glabrous: pappus of ciliate scales united only at base. (*Ritro*: name of this plant in S. Eu.) S. Eu. to Siberia.—The plant grown under this name is *E. exaltatus*.

4. ***E. exaltatus***, Schrad. Per. 3-12 ft. high, sts. simple or branched, white-tomentose: lvs. pinnatifid into lanceolate acuminate spinose-toothed segms., the upper surface rough and setulose and deep green, the lower white-tomentose, radical lvs. much larger and petioled: heads 1½-2 in. across, bluish, on tomentose peduncles; outer bristle-like bracts about half as long as the acuminate fimbriate inner bracts which are glabrous on back: achenes hairy; pappus-scales toothed. Siberia.—Apparently this is the commonly cult. species, grown under many names, usually erroneously as *E. sphærocephalus* and *E. Ritro*.

95. **CNICUS**, L. **BLESSED THISTLE.** One species, native to the Medit. region and the Caucasus.—Thistle-like branching ann.: heads sessile, rayless, surrounded by a cluster of large bristly leafy bracts; involucre bracts in few rows, the outer tipped with a long simple spine, the inner terminating in a long spinose-pinnatifid thorn: pappus-bristles in 2 series, the inner longer than the outer. (*Cni-cus*: Latin name of safflower, early applied to thistles; pronounced *ni-kus*.)

C. benedictus, L. (*Carduus benedictus*, Auth.). To 2 ft. high, sts. hairy: lvs. oblong, 2-6 in. long, sinuate-pinnatifid and toothed, the lobes and teeth spiny: heads 1 in. wide, terminating the branches; fls. yellow. Nat. in N. Amer.—Sometimes cult. for curiosity or ornament.

96. CARLINA, L. Thistle-like herbs, of about 20 species in Eu. and Asia, one sometimes planted.—Lvs. pinnatifid, with spiny teeth: heads large, solitary or in corymbs, many-fl'd.; involueral bracts imbricated in many series, the outer lf.-like and spiny-toothed, the inner colored and ray-like and much longer than fls.; receptacle bristly; fls. bisexual, all alike: achenes cylindrical, hairy; pappus deciduous, of 1 row of plumose bristles. (Carli-na: name of uncertain derivation.)

C. acaulis, L. Per., stemless or nearly so, with thick woody root: lvs. in rosettes, oblong, to 1 ft. long and $2\frac{1}{2}$ in. wide, pinnate into spiny segms., glabrous or somewhat pubescent beneath: heads solitary, 2-6 in. across; inner involueral bracts linear and pointed, shining white or somewhat yellowish on back; fls. white or reddish: pappus two to three times as long as achene. S. Eu.

97. ONOPORDUM, L. Coarse woolly thistle-like annuals or biennials of the Old World, over 20 species, one not infrequent in gardens for ornament.—Sts. stout (sometimes acaulescent), winged by the decurrent lf.-bases: lvs. large, alternate, prickly dentate or pinnately cut: heads large, solitary or clustered, of disk-fls. only; involuere globose, the bracts sometimes spiny; receptacle flat, fleshy, honeycombed, not bristly: pappus of bristles in several series. (Onopor-dum: old Greek name.)

O. Acanthium, L. SCOTCH THISTLE. White-cottony-tomentose bien., vigorous, much-branched, 3-9 ft. high: lvs. oblong, prickly, sinuate-lobed and toothed, acute, the lower often 1 ft. long: heads $1\frac{1}{2}$ -2 in. across, usually borne singly on the branches; fls. pale purple, in a var. white: bristles of pappus brownish, longer than achene. (Acanthium: Greek *thorn*; herbalist name.) Eu., Asia; nat. in E. N. Amer.

98. SILYBUM, Adans. MILK THISTLE. Two species, Eu., Afr. and Asia, one rarely grown for ornament.—Glabrous erect thistle-like herbs: lvs. with spinose-toothed lobes, conspicuously white-spotted above: heads large, solitary, terminal, nodding; involuere broadly subglobose, the bracts in many rows, stiff, spiny-margined and spine-tipped; receptacle fleshy, bristly; fls. purplish, all bisexual; corollatube slender, the limb 5-cleft to middle or base: pappus-bristles minutely barbellate, in several series, united at base, deciduous. (Sil-ybum: an old Greek name applied by Dioscorides to some thistle-like plants.)

S. Marianum, Gaertn. (*Carduus Marianus*, L.). ST. MARYS, BLESSED OR HOLY THISTLE. Glossy-leaved ann. or bien. 1-4 ft. high: lvs. clasping, $1\frac{1}{2}$ - $2\frac{1}{2}$ ft. long and 6-12 in. across, undulate: heads $1\frac{1}{2}$ - $2\frac{1}{2}$ in. across; involueral bracts leathery, with a spine $\frac{1}{2}$ - $\frac{3}{4}$ in. long, or the outer mucronate; fls. rose-purple: achenes glabrous, $\frac{1}{4}$ in. long, spotted brown; pappus shining white. (Marianum: Mary, Mother of Christ; of early usage.) S. Eu., N. Afr. and Asia; nat. in Calif. and elsewhere in U. S.

99. CYNARA, L. Ten or 12 species in the Medit. region and Canary Isls., two grown as garden vegetables.—Thistle-like per. herbs, mostly coarse and sometimes prickly: lvs. commonly large, variously lobed or pinnatisect: heads large, terminating important branches, the corollas violet, blue or white; involuere broad or nearly globular, with bracts in many series and more or less enlarged at base; receptacle fleshy and plane, bristly; corolla slender-tubed, 5-parted: fr. a thick glabrous compressed or 4-angled achene with truncate apex; pappus of many series of plumose bristles. (Cyn-ara: involuere-spines likened to a dog's tooth.)

A. Lvs. prominently spiny: involueral bracts spinose-tipped. 1. *C. Cardunculus*
AA. Lvs. hardly at all spiny: involueral bracts unarmed. 2. *C. Scolymus*

1. **C. Cardunculus**, L. CARDOON. Robust plant to 6 ft. high or more, cult. for its edible root and thickened lf.-stalks, also sometimes for ornament: lvs. very large, deeply pinnatifid, grayish-green above, whitish beneath with dense tomentum, prominently spiny: heads purple-fl'd. with spine-tipped involueral bracts. (Cardunculus: diminutive of Car-duus, S. Eu.)

2. **C. Scolymus**, L. ARTICHOKE. Less stout than the cardoon, usually 3-5 ft.: lvs. less pinnatifid, hardly at all spiny: heads larger, the receptacle enlarged and fleshy; involueral

bracts broad, thickened at base, unarmed. (Scolymus: a genus of thistles, the word meaning spine or thorn.) Probably a derivative of the last.—Cult. for the soft fleshy receptacle of the fl.-head and the thickened base of the involucre bracts which are edible.

100. **VERNONIA**, Schreber. **IRONWEED**. A large widely distributed genus of over 500 species, one often transferred to the garden.—Herbs, vines or shrubs: lvs. usually alternate; heads of disk-fls. only, purple, pink or white, borne in terminal clusters in late summer and autumn; involucre of bracts imbricated in several series; receptacle naked; corolla tubular, 5-parted: achenes ribbed; pappus in 2 series, the inner of bristles, the outer of short bristles or scales. (Vernonia: named for William Vernon, English botanist of late 17th century.)

V. noveboracensis, Willd. (*Serratula noveboracensis*, L.). Per. 3-9 ft. high: lvs. oblong to lanceolate, 3-10 in. long and $\frac{1}{2}$ -1 $\frac{1}{2}$ in. wide, acuminate, finely toothed: heads deep purple, $\frac{1}{2}$ in. across, peduncled; involucre bracts with filiform tips: pappus purplish. Mass. to N. C. and Miss.

101. **STOKESIA**, L'Her. **STOKES ASTER**. One species, native to N. Amer., cult. for its fls.—Coarse per. herb: lvs. alternate, spinose-toothed toward base or entire, the lower petiolate, upper sessile: heads large, many-fl'd., terminating the branches; involucre bracts in many series, the outer leafy, inner with foliaceous pinnately spinose-toothed appendages; receptacle fleshy, flat, naked; marginal fls. much larger than inner, deeply 5-lobed: achenes angled; pappus of 4-5 slender deciduous scales. (Stokesia: Jonathan Stokes, M. D., 1755-1831, English botanist.)

S. laevis, Greene (*Carthamus laevis*, Hill. *S. cyanea*, L'Her.). One to 2 ft. high, much-branched, sts. tomentose above: lvs. broad-lanceolate, acute, 2-8 in. long: heads solitary, blue or purplish-blue, 3-4 in. across. S. C. to Fla. and La.—Color variations are *alba*, white, *cærulea*, blue, *lilacina*, lilac.

INDEX

The entries in usual roman type are the names of genera and species printed in blackface in the book, and of English names. The entries in italic type are those of synonyms and incidental references.
